Calls `rdbuf ()->str (s)`.

Definition at line 593 of file sstream.

4.618.5.90 `template<typename _CharT, typename _Traits> int std::basic_istream<_CharT, _Traits>::sync (void)
[inherited]`

Synchronizing the stream buffer.

Returns

0 on success, -1 on failure

If `rdbuf ()` is a null pointer, returns -1.

Otherwise, calls `rdbuf ()->pubsync ()`, and if that returns -1, sets `badbit` and returns -1.

Otherwise, returns 0.

Note

This function does not count the number of characters extracted, if any, and therefore does not affect the next call to `gcount ()`.

Definition at line 781 of file istream.tcc.

References `std::ios_base::badbit`, `std::ios_base::goodbit`, `std::basic_streambuf<_CharT, _Traits>::pubsync()`, `std::basic_ios<_CharT, _Traits>::rdbuf()`, and `std::basic_ios<_CharT, _Traits>::setstate()`.

4.618.5.91 `static bool std::ios_base::sync_with_stdio (bool __sync = true) [static], [inherited]`

Interaction with the standard C I/O objects.

Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1.html>

4.618.5.92 `template<typename _CharT, typename _Traits> basic_istream< _CharT, _Traits >::pos_type
std::basic_istream< _CharT, _Traits >::tellg (void) [inherited]`

Getting the current read position.

Returns

A file position object.

If `fail()` is not false, returns `pos_type(-1)` to indicate failure. Otherwise returns `rdbuf()->pubseekoff(0, cur, in)`.

Note

This function does not count the number of characters extracted, if any, and therefore does not affect the next call to `gcount()`. At variance with `putback`, `unget` and `seekg`, `eofbit` is not cleared first.

Definition at line 817 of file `istream.tcc`.

References `std::ios_base::badbit`, `std::ios_base::cur`, `std::basic_ios< _CharT, _Traits >::fail()`, `std::ios_base::in`, and `std::basic_ios< _CharT, _Traits >::rdbuf()`.

4.618.5.93 `template<typename _CharT, typename _Traits> basic_ostream< _CharT, _Traits >::pos_type
std::basic_ostream< _CharT, _Traits >::tellp () [inherited]`

Getting the current write position.

Returns

A file position object.

If `fail()` is not false, returns `pos_type(-1)` to indicate failure. Otherwise returns `rdbuf()->pubseekoff(0, cur, out)`.

Definition at line 237 of file `ostream.tcc`.

References `std::ios_base::badbit`, `std::ios_base::cur`, `std::basic_ios< _CharT, _Traits >::fail()`, `std::ios_base::out`, and `std::basic_ios< _CharT, _Traits >::rdbuf()`.

4.618.5.94 `template<typename _CharT, typename _Traits = char_traits<_CharT>> basic_ostream<_CharT, _Traits>*
std::basic_ios<_CharT, _Traits>::tie () const [inline], [inherited]`

Fetches the current *tied* stream.

Returns

A pointer to the tied stream, or NULL if the stream is not tied.

A stream may be *tied* (or synchronized) to a second output stream. When this stream performs any I/O, the tied stream is first flushed. For example, `std::cin` is tied to `std::cout`.

Definition at line 289 of file `basic_ios.h`.

Referenced by `std::basic_ios< _CharT, _Traits >::copyfmt()`, `std::basic_ostream< _CharT, _Traits >::sentry::sentry()`, and `std::basic_istream< _CharT, _Traits >::sentry::sentry()`.

```
4.618.5.95 template<typename _CharT, typename _Traits = char_traits<_CharT>> basic_ostream<_CharT, _Traits>*  
std::basic_ios<_CharT, _Traits>::tie ( basic_ostream<_CharT, _Traits> * __tiestr ) [inline],  
[inherited]
```

Ties this stream to an output stream.

Parameters

<code>__tiestr</code>	The output stream.
-----------------------	--------------------

Returns

The previously tied output stream, or NULL if the stream was not tied.

This sets up a new tie; see `tie()` for more.

Definition at line 301 of file `basic_ios.h`.

4.618.5.96 `template<typename _CharT, typename _Traits> basic_istream< _CharT, _Traits> & std::basic_istream< _CharT, _Traits>::unget (void) [inherited]`

Unextracting the previous character.

Returns

`*this`

If `rdbuf()` is not null, calls `rdbuf() -> sungetc(c)`.

If `rdbuf()` is null or if `sungetc()` fails, sets `badbit` in the error state.

Note

This function first clears `eofbit`. Since no characters are extracted, the next call to `gcount()` will return 0, as required by DR 60.

Definition at line 746 of file `istream.tcc`.

References `std::basic_istream< _CharT, _Traits>::M_gcount`, `std::ios_base::badbit`, `std::basic_ios< _CharT, _Traits>::clear()`, `std::ios_base::eofbit`, `std::ios_base::goodbit`, `std::basic_ios< _CharT, _Traits>::rdbuf()`, `std::basic_ios< _CharT, _Traits>::rdstate()`, `std::basic_ios< _CharT, _Traits>::setstate()`, and `std::basic_streambuf< _CharT, _Traits>::sungetc()`.

4.618.5.97 `void std::ios_base::unsetf (fmtflags __mask) [inline],[inherited]`

Clearing format flags.

Parameters

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

Definition at line 610 of file `ios_base.h`.

Referenced by `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, and `std::nouppercase()`.

4.618.5.98 `template<typename _CharT, typename _Traits = char_traits<_CharT>> char_type std::basic_ios< _CharT, _Traits>::widen (char __c) const [inline],[inherited]`

Widens characters.

Parameters

<code>__c</code>	The character to widen.
------------------	-------------------------

Returns

The widened character.

Maps a character of `char` to a character of `char_type`.

Returns the result of

```
* std::use_facet<ctype<char_type> > (getloc()).widen(c)
*
```

Additional I10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.-html>

Definition at line 443 of file `basic_ios.h`.

Referenced by `std::basic_ios< char, char_traits< char > >::fill()`, `std::basic_istream< char >::get()`, `std::basic_istream< char >::getline()`, `std::getline()`, and `std::operator>>()`.

4.618.5.99 `streamsize std::ios_base::width () const` `[inline]`, `[inherited]`

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.

Definition at line 644 of file `ios_base.h`.

Referenced by `std::basic_ios< _CharT, _Traits >::copyfmt()`, `std::num_put< _CharT, _OutIter >::do_put()`, and `std::operator>>()`.

4.618.5.100 `streamsize std::ios_base::width (streamsize __wide)` `[inline]`, `[inherited]`

Changing flags.

Parameters

<code>__wide</code>	The new width value.
---------------------	----------------------

Returns

The previous value of `width()`.

Definition at line 653 of file `ios_base.h`.

4.618.5.101 `template<typename _CharT, typename _Traits > basic_ostream< _CharT, _Traits > & std::basic_ostream< _CharT, _Traits >::write (const char_type * __s, streamsize __n)` `[inherited]`

Character string insertion.

Parameters

<code>__s</code>	The array to insert.
<code>__n</code>	Maximum number of characters to insert.

Returns

`*this`

Characters are copied from `__s` and inserted into the stream until one of the following happens:

- `__n` characters are inserted
- inserting into the output sequence fails (in this case, `badbit` will be set in the stream's error state)

Note

This function is not overloaded on signed char and unsigned char.

Definition at line 183 of file `ostream.tcc`.

References `std::basic_ostream<_CharT, _Traits>::_M_write()`, and `std::ios_base::badbit`.

4.618.5.102 `static int std::ios_base::xalloc () throw ()` `[static], [inherited]`

Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

4.618.6 Member Data Documentation

4.618.6.1 `template<typename _CharT, typename _Traits = char_traits<_CharT>> streamsize std::basic_istream<_CharT, _Traits>::_M_gcount` `[protected], [inherited]`

The number of characters extracted in the previous unformatted function; see `gcount()`.

Definition at line 82 of file `istream`.

Referenced by `std::basic_istream<char>::gcount()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::getline()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::basic_istream<_CharT, _Traits>::peek()`, `std::basic_istream<_CharT, _Traits>::putback()`, `std::basic_istream<_CharT, _Traits>::read()`, `std::basic_istream<_CharT, _Traits>::readsome()`, `std::basic_istream<_CharT, _Traits>::unget()`, and `std::basic_istream<char>::~~basic_istream()`.

4.618.6.2 `const fmtflags std::ios_base::adjustfield` `[static], [inherited]`

A mask of `left|right|internal`. Useful for the 2-arg form of `setf`.

Definition at line 310 of file `ios_base.h`.

Referenced by `std::num_put<_CharT, _Outlter>::do_put()`, `std::internal()`, `std::left()`, and `std::right()`.

4.618.6.3 const openmode std::ios_base::app [static],[inherited]

Seek to end before each write.

Definition at line 364 of file ios_base.h.

Referenced by std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), and std::basic_filebuf< _CharT, _Traits >::xsputn().

4.618.6.4 const openmode std::ios_base::ate [static],[inherited]

Open and seek to end immediately after opening.

Definition at line 367 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::open().

4.618.6.5 const iostate std::ios_base::badbit [static],[inherited]

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file ios_base.h.

Referenced by std::basic_ostream< char >::_M_write(), std::basic_ios< char, char_traits< char > >::bad(), std::basic_ios< char, char_traits< char > >::fail(), std::basic_ostream< _CharT, _Traits >::flush(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_ostream< _CharT, _Traits >::operator<<(), std::operator<<(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::peek(), std::basic_ostream< _CharT, _Traits >::put(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::read(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_istream< _CharT, _Traits >::sync(), std::basic_istream< _CharT, _Traits >::tellg(), std::basic_ostream< _CharT, _Traits >::tellp(), std::basic_istream< _CharT, _Traits >::unget(), std::basic_ostream< _CharT, _Traits >::write(), and std::basic_ostream< _CharT, _Traits >::sentry::~sentry().

4.618.6.6 const fmtflags std::ios_base::basefield [static],[inherited]

A mask of dec|oct|hex. Useful for the 2-arg form of setf.

Definition at line 313 of file ios_base.h.

Referenced by std::dec(), std::num_get< _CharT, _InIter >::do_get(), std::hex(), std::oct(), and std::basic_ostream< _CharT, _Traits >::operator<<().

4.618.6.7 const seekdir std::ios_base::beg [static],[inherited]

Request a seek relative to the beginning of the stream.

Definition at line 396 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::seekpos().

4.618.6.8 const openmode std::ios_base::binary [static],[inherited]

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html>.

Definition at line 372 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::showmanyc().

4.618.6.9 const fmtflags std::ios_base::boolalpha [static],[inherited]

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file `ios_base.h`.

Referenced by `std::boolalpha()`, `std::num_get<_CharT, _Inlter >::do_get()`, `std::num_put<_CharT, _Outlter >::do_put()`, and `std::noboolalpha()`.

4.618.6.10 const seekdir std::ios_base::cur [static],[inherited]

Request a seek relative to the current position within the sequence.

Definition at line 399 of file `ios_base.h`.

Referenced by `std::basic_filebuf<_CharT, _Traits >::imbue()`, `std::basic_stringbuf<_CharT, _Traits, _Alloc >::seekoff()`, `std::basic_filebuf<_CharT, _Traits >::seekoff()`, `std::basic_istream<_CharT, _Traits >::tellg()`, and `std::basic_ostream<_CharT, _Traits >::tellp()`.

4.618.6.11 const fmtflags std::ios_base::dec [static],[inherited]

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file `ios_base.h`.

Referenced by `std::dec()`.

4.618.6.12 const seekdir std::ios_base::end [static],[inherited]

Request a seek relative to the current end of the sequence.

Definition at line 402 of file `ios_base.h`.

Referenced by `std::basic_filebuf<_CharT, _Traits >::open()`, and `std::basic_stringbuf<_CharT, _Traits, _Alloc >::seekoff()`.

4.618.6.13 const iostate std::ios_base::eofbit [static],[inherited]

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file `ios_base.h`.

Referenced by `std::num_get<_CharT, _Inlter >::do_get()`, `std::time_get<_CharT, _Inlter >::do_get_date()`, `std::time_get<_CharT, _Inlter >::do_get_monthname()`, `std::time_get<_CharT, _Inlter >::do_get_time()`, `std::time_get<_CharT, _Inlter >::do_get_weekday()`, `std::time_get<_CharT, _Inlter >::do_get_year()`, `std::basic_ios<char, char_traits<char > >::eof()`, `std::basic_istream<_CharT, _Traits >::get()`, `std::basic_istream<_CharT, _Traits >::getline()`, `std::basic_istream<_CharT, _Traits >::ignore()`, `std::basic_istream<_CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_istream<_CharT, _Traits >::peek()`, `std::basic_istream<_CharT, _Traits >::putback()`, `std::basic_istream<_CharT, _Traits >::read()`, `std::basic_istream<_CharT, _Traits >::readsome()`, `std::basic_istream<_CharT, _Traits >::seekg()`, `std::basic_istream<_CharT, _Traits >::sentry::sentry()`, `std::basic_istream<_CharT, _Traits >::unget()`, and `std::ws()`.

4.618.6.14 const iostate std::ios_base::failbit [static],[inherited]

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file `ios_base.h`.

Referenced by `std::basic_ifstream<_CharT, _Traits >::close()`, `std::basic_ofstream<_CharT, _Traits >::close()`, `std::basic_fstream<_CharT, _Traits >::close()`, `std::num_get<_CharT, _Inlter >::do_get()`, `std::time_get<_CharT, _Inlter >::do_get_monthname()`, `std::time_get<_CharT, _Inlter >::do_get_weekday()`, `std::time_get<_CharT, _Inlter`

>::do_get_year(), std::basic_ios<char, char_traits<char>>::fail(), std::basic_istream<_CharT, _Traits>::get(), std::basic_istream<_CharT, _Traits>::getline(), std::basic_ifstream<_CharT, _Traits>::open(), std::basic_ofstream<_CharT, _Traits>::open(), std::basic_fstream<_CharT, _Traits>::open(), std::basic_ostream<_CharT, _Traits>::operator<<(), std::basic_istream<_CharT, _Traits>::operator>>(), std::operator>>(), std::basic_istream<_CharT, _Traits>::read(), std::basic_istream<_CharT, _Traits>::seekg(), std::basic_ostream<_CharT, _Traits>::seekp(), std::basic_ostream<_CharT, _Traits>::sentry::sentry(), and std::basic_istream<_CharT, _Traits>::sentry::sentry().

4.618.6.15 const fmtflags std::ios_base::fixed [static], [inherited]

Generate floating-point output in fixed-point notation.

Definition at line 264 of file ios_base.h.

Referenced by std::fixed().

4.618.6.16 const fmtflags std::ios_base::floatfield [static], [inherited]

A mask of scientific|fixed. Useful for the 2-arg form of setf.

Definition at line 316 of file ios_base.h.

Referenced by std::fixed(), and std::scientific().

4.618.6.17 const iostate std::ios_base::goodbit [static], [inherited]

Indicates all is well.

Definition at line 345 of file ios_base.h.

Referenced by std::num_get<_CharT, _Inlter>::do_get(), std::time_get<_CharT, _Inlter>::do_get_monthname(), std::time_get<_CharT, _Inlter>::do_get_weekday(), std::time_get<_CharT, _Inlter>::do_get_year(), std::basic_ostream<_CharT, _Traits>::flush(), std::basic_istream<_CharT, _Traits>::get(), std::basic_istream<_CharT, _Traits>::getline(), std::basic_istream<_CharT, _Traits>::ignore(), std::basic_ostream<_CharT, _Traits>::operator<<(), std::basic_istream<_CharT, _Traits>::operator>>(), std::operator>>(), std::basic_istream<_CharT, _Traits>::peek(), std::basic_ostream<_CharT, _Traits>::put(), std::basic_istream<_CharT, _Traits>::putback(), std::basic_istream<_CharT, _Traits>::read(), std::basic_istream<_CharT, _Traits>::readsome(), std::basic_istream<_CharT, _Traits>::seekg(), std::basic_ostream<_CharT, _Traits>::seekp(), std::basic_istream<_CharT, _Traits>::sentry::sentry(), std::basic_istream<_CharT, _Traits>::sync(), and std::basic_istream<_CharT, _Traits>::unget().

4.618.6.18 const fmtflags std::ios_base::hex [static], [inherited]

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file ios_base.h.

Referenced by std::num_get<_CharT, _Inlter>::do_get(), std::num_put<_CharT, _Outlter>::do_put(), std::hex(), and std::basic_ostream<_CharT, _Traits>::operator<<().

4.618.6.19 const openmode std::ios_base::in [static], [inherited]

Open for input. Default for ifstream and fstream.

Definition at line 375 of file ios_base.h.

Referenced by std::basic_filebuf<char_type, traits_type>::M_set_buffer(), std::basic_ifstream<_CharT, _Traits>::open(), std::basic_istream<_CharT, _Traits>::seekg(), std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekoff(), std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos(), std::basic_stringbuf<_CharT, _Traits, _Alloc>::showmanyc(), std::basic_filebuf<_CharT, _Traits>::showmanyc(), std::basic_istream<_CharT, _Traits>::tellg(), std::basic_stringbuf<_CharT, _Traits, _Alloc>::underflow(), std::basic_filebuf<_CharT, _Traits>::underflow(), and std::basic_filebuf<_CharT, _Traits>::xsgetn().

4.618.6.20 `const fmtflags std::ios_base::internal` `[static], [inherited]`

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file `ios_base.h`.

Referenced by `std::internal()`.

4.618.6.21 `const fmtflags std::ios_base::left` `[static], [inherited]`

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file `ios_base.h`.

Referenced by `std::num_put< _CharT, _Outiter >::do_put()`, and `std::left()`.

4.618.6.22 `const fmtflags std::ios_base::oct` `[static], [inherited]`

Converts integer input or generates integer output in octal base.

Definition at line 279 of file `ios_base.h`.

Referenced by `std::oct()`, and `std::basic_ostream< _CharT, _Traits >::operator<<()`.

4.618.6.23 `const openmode std::ios_base::out` `[static], [inherited]`

Open for output. Default for `ofstream` and `fstream`.

Definition at line 378 of file `ios_base.h`.

Referenced by `std::basic_filebuf< char_type, traits_type >::_M_set_buffer()`, `std::basic_ofstream< _CharT, _Traits >::open()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_ostream< _CharT, _Traits >::seekp()`, `std::basic_ostream< _CharT, _Traits >::tellp()`, and `std::basic_filebuf< _CharT, _Traits >::xsputn()`.

4.618.6.24 `const fmtflags std::ios_base::right` `[static], [inherited]`

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file `ios_base.h`.

Referenced by `std::right()`.

4.618.6.25 `const fmtflags std::ios_base::scientific` `[static], [inherited]`

Generates floating-point output in scientific notation.

Definition at line 286 of file `ios_base.h`.

Referenced by `std::scientific()`.

4.618.6.26 `const fmtflags std::ios_base::showbase` `[static], [inherited]`

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file `ios_base.h`.

Referenced by `std::noshowbase()`, and `std::showbase()`.

4.618.6.27 `const fmtflags std::ios_base::showpoint` `[static], [inherited]`

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file `ios_base.h`.

Referenced by `std::noshowpoint()`, and `std::showpoint()`.

4.618.6.28 `const fmtflags std::ios_base::showpos` `[static]`, `[inherited]`

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file `ios_base.h`.

Referenced by `std::noshowpos()`, and `std::showpos()`.

4.618.6.29 `const fmtflags std::ios_base::skipws` `[static]`, `[inherited]`

Skips leading white space before certain input operations.

Definition at line 300 of file `ios_base.h`.

Referenced by `std::noskipws()`, `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, and `std::skipws()`.

4.618.6.30 `const openmode std::ios_base::trunc` `[static]`, `[inherited]`

Open for input. Default for `ofstream`.

Definition at line 381 of file `ios_base.h`.

4.618.6.31 `const fmtflags std::ios_base::unitbuf` `[static]`, `[inherited]`

Flushes output after each output operation.

Definition at line 303 of file `ios_base.h`.

Referenced by `std::nunitbuf()`, `std::unitbuf()`, and `std::basic_ostream<_CharT, _Traits>::sentry::~sentry()`.

4.618.6.32 `const fmtflags std::ios_base::uppercase` `[static]`, `[inherited]`

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file `ios_base.h`.

Referenced by `std::num_put<_CharT, _OutIter>::do_put()`, `std::nouppercase()`, and `std::uppercase()`.

4.619.1 Detailed Description

A Bernoulli random number distribution.

Generates a sequence of true and false values with likelihood p that true will come up and $(1 - p)$ that false will appear.

Definition at line 3572 of file random.h.

4.619.2 Member Typedef Documentation

4.619.2.1 typedef bool std::bernoulli_distribution::result_type

The type of the range of the distribution.

Definition at line 3576 of file random.h.

4.619.3 Constructor & Destructor Documentation

4.619.3.1 std::bernoulli_distribution::bernoulli_distribution (double __p = 0.5) [inline], [explicit]

Constructs a Bernoulli distribution with likelihood p .

Parameters

__p	[IN] The likelihood of a true result being returned. Must be in the interval $[0, 1]$.
---------------------	---

Definition at line 3609 of file random.h.

4.619.4 Member Function Documentation

4.619.4.1 **result_type** std::bernoulli_distribution::max () const [inline]

Returns the least upper bound value of the distribution.

Definition at line 3659 of file random.h.

References std::numeric_limits< _Tp >::max().

4.619.4.2 **result_type** std::bernoulli_distribution::min () const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3652 of file random.h.

References std::numeric_limits< _Tp >::min().

4.619.4.3 **template**<typename _UniformRandomNumberGenerator > **result_type** std::bernoulli_distribution::operator() (_UniformRandomNumberGenerator & __urng) [inline]

Generating functions.

Definition at line 3667 of file random.h.

4.619.4.4 **double** std::bernoulli_distribution::p () const [inline]

Returns the *p* parameter of the distribution.

Definition at line 3630 of file random.h.

4.619.4.5 **param_type** std::bernoulli_distribution::param () const [inline]

Returns the parameter set of the distribution.

Definition at line 3637 of file random.h.

Referenced by std::operator>>().

4.619.4.6 **void** std::bernoulli_distribution::param (const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.
----------------	--

Definition at line 3645 of file random.h.

4.619.4.7 **void** std::bernoulli_distribution::reset () [inline]

Resets the distribution state.

Does nothing for a Bernoulli distribution.

Definition at line 3624 of file random.h.

4.619.5 Friends And Related Function Documentation

4.619.5.1 **bool** operator== (const bernoulli_distribution & __d1, const bernoulli_distribution & __d2) [friend]

Return true if two Bernoulli distributions have the same parameters.

Definition at line 3709 of file random.h.

&__x)

4.626.1 Detailed Description

```
template<typename _IntType = int>class std::binomial_distribution< _IntType >
```

A discrete binomial random number distribution.

The formula for the binomial probability density function is $p(i|t, p) = \binom{t}{i} p^i (1 - p)^{t-i}$ where t and p are the parameters of the distribution.

Definition at line 3777 of file random.h.

4.626.2 Member Typedef Documentation

4.626.2.1 `template<typename _IntType = int> typedef _IntType std::binomial_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 3780 of file random.h.

4.626.3 Member Function Documentation

4.626.3.1 `template<typename _IntType = int> result_type std::binomial_distribution< _IntType >::max ()` const
`[inline]`

Returns the least upper bound value of the distribution.

Definition at line 3887 of file random.h.

4.626.3.2 `template<typename _IntType = int> result_type std::binomial_distribution< _IntType >::min ()` const
`[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 3880 of file random.h.

4.626.3.3 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator >
binomial_distribution<_IntType>::result_type std::binomial_distribution< _IntType >::operator() (
_UniformRandomNumberGenerator & __urng, const param_type & __param)`

A rejection algorithm when $t * p \geq 8$ and a simple waiting time method - the second in the referenced book - otherwise.
NB: The former is available only if `_GLIBCXX_USE_C99_MATH_TR1` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sect. 4 (+ Errata!).

4.626.3.4 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type
std::binomial_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 3895 of file `random.h`.

4.626.3.5 `template<typename _IntType = int> double std::binomial_distribution< _IntType >::p () const [inline]`

Returns the distribution `p` parameter.

Definition at line 3858 of file `random.h`.

4.626.3.6 `template<typename _IntType = int> param_type std::binomial_distribution< _IntType >::param () const
[inline]`

Returns the parameter set of the distribution.

Definition at line 3865 of file `random.h`.

4.626.3.7 `template<typename _IntType = int> void std::binomial_distribution< _IntType >::param (const param_type &
__param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3873 of file `random.h`.

4.626.3.8 `template<typename _IntType = int> void std::binomial_distribution< _IntType >::reset () [inline]`

Resets the distribution state.

Definition at line 3844 of file `random.h`.

References `std::normal_distribution< _RealType >::reset()`.

4.626.3.9 `template<typename _IntType = int> _IntType std::binomial_distribution< _IntType >::t () const [inline]`

Returns the distribution `t` parameter.

Definition at line 3851 of file `random.h`.

4.626.4 Friends And Related Function Documentation

4.626.4.1 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const
std::binomial_distribution< _IntType1 > & __x) [friend]`

Inserts a `binomial_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>binomial_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.626.4.2 `template<typename _IntType = int> bool operator==(const binomial_distribution<_IntType> &__d1, const binomial_distribution<_IntType> &__d2) [friend]`

Return true if two binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3931 of file `random.h`.

4.626.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>>(std::basic_istream<_CharT, _Traits> &__is, std::binomial_distribution<_IntType1> &__x) [friend]`

Extracts a `binomial_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>binomial_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.630.1 Detailed Description

```
template<class _CharT>struct std::char_traits<_CharT>
```

Basis for explicit traits specializations.

Note

For any given actual character type, this definition is probably wrong. Since this is just a thin wrapper around `__gnu_cxx::char_traits`, it is possible to achieve a more appropriate definition by specializing `__gnu_cxx::char_traits`.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt05ch13s03.html> for advice on how to make use of this class for *unusual* character types. Also, check out `include/ext/pod_char_traits.h`.

Definition at line 227 of file `char_traits.h`.

4.634.1 Detailed Description

```
template<typename _RealType = double>class std::chi_squared_distribution< _RealType >
```

A chi_squared_distribution random number distribution.

The formula for the normal probability mass function is $p(x|n) = \frac{x^{(n/2)-1} e^{-x/2}}{\Gamma(n/2) 2^{n/2}}$

Definition at line 2719 of file random.h.

4.634.2 Member Typedef Documentation

```
4.634.2.1 template<typename _RealType = double> typedef _RealType std::chi_squared_distribution< _RealType
>::result_type
```

The type of the range of the distribution.

Definition at line 2722 of file random.h.

4.634.3 Member Function Documentation

```
4.634.3.1 template<typename _RealType = double> result_type std::chi_squared_distribution< _RealType >::max ( )
const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 2799 of file random.h.

References std::numeric_limits< _Tp >::max().

```
4.634.3.2 template<typename _RealType = double> result_type std::chi_squared_distribution< _RealType >::min ( )
const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 2792 of file random.h.

```
4.634.3.3 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type
std::chi_squared_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng )
[inline]
```

Generating functions.

Definition at line 2807 of file random.h.

```
4.634.3.4 template<typename _RealType = double> param_type std::chi_squared_distribution< _RealType >::param ( )
const [inline]
```

Returns the parameter set of the distribution.

Definition at line 2777 of file random.h.

```
4.634.3.5 template<typename _RealType = double> void std::chi_squared_distribution< _RealType >::param ( const
param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2785 of file random.h.

4.634.3.6 `template<typename _RealType = double> void std::chi_squared_distribution<_RealType>::reset ()`
`[inline]`

Resets the distribution state.

Definition at line 2763 of file random.h.

References `std::gamma_distribution<_RealType>::reset()`.

4.634.4 Friends And Related Function Documentation

4.634.4.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits>`
`std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::chi_squared_distribution<_RealType1> & __x) [friend]`

Inserts a `chi_squared_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>chi_squared_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.634.4.2 `template<typename _RealType = double> bool operator==(const chi_squared_distribution<_RealType> & __d1,`
`const chi_squared_distribution<_RealType> & __d2) [friend]`

Return true if two Chi-squared distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2858 of file random.h.

4.634.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits`
`> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,`
`std::chi_squared_distribution<_RealType1> & __x) [friend]`

Extracts a `chi_squared_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>chi_squared_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.642.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>class std::codecvt< _InternT, _ExternT, _StateT >
```

Primary class template codecvt.

NB: Generic, mostly useless implementation.

Definition at line 276 of file codecvt.h.

4.642.2 Member Function Documentation

4.642.2.1 `template<typename _InternT, typename _ExternT, typename _StateT> virtual result std::codecvt< _InternT, _ExternT, _StateT>::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * __&__from_next, extern_type * __to, extern_type * __to_end, extern_type * __&__to_next) const`
`[protected], [virtual]`

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See Also

out for more information.

Implements [std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >](#).

```
4.642.2.2 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::in ( state_type & __state, const extern_type * __from, const extern_type * __from_end,
    const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 196 of file `codecvt.h`.

```
4.642.2.3 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end,
    const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

```
4.642.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type
    *& __to_next ) const    [inline],[inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 155 of file `codecvt.h`.

4.643.1 Detailed Description

template<typename _InternT, typename _ExternT>class std::codecvt< _InternT, _ExternT, encoding_state >

codecvt<InternT, _ExternT, encoding_state> specialization.

Definition at line 230 of file codecvt_specializations.h.

4.643.2 Member Function Documentation

4.643.2.1 template<typename _InternT, typename _ExternT > codecvt_base::result std::codecvt< _InternT, _ExternT, encoding_state >::do_out(state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See Also

out for more information.

Implements std::__codecvt_abstract_base< _InternT, _ExternT, encoding_state >.

Definition at line 306 of file codecvt_specializations.h.

4.643.2.2 result std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::in (state_type & __state, const extern_type * __from, const extern_type * __from_end, const extern_type *& __from_next, intern_type * __to, intern_type * __to_end, intern_type *& __to_next) const [inline],[inherited]

Convert from external to internal character set.

Converts input string of extern_type to output string of intern_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 196 of file codecvt.h.

4.643.2.3 result std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type *& __from_next, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const [inline],[inherited]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This is analogous to wcsrtombs. It does this by calling codecvt::do_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

References `std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::do_out()`.

4.643.2.4 `result std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::unshift (state_type & __state, extern_type * __to, extern_type * __to_end, extern_type *& __to_next) const` `[inline],[inherited]`

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 155 of file `codecvt.h`.

4.645.1 Detailed Description

template<>class std::codecvt< wchar_t, char, mbstate_t >

class codecvt<wchar_t, char, mbstate_t> specialization.

Definition at line 398 of file codecvt.h.

4.645.2 Member Function Documentation

- 4.645.2.1 virtual result std::codecvt< wchar_t, char, mbstate_t >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * __&__from_next, extern_type * __to, extern_type * __to_end, extern_type * __&__to_next) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See Also

out for more information.

Implements [std::__codecvt_abstract_base< wchar_t, char, mbstate_t >](#).

4.645.2.2 result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::in (state_type & __state, const extern_type * __from, const extern_type * __from_end, const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next) const [inline], [inherited]

Convert from external to internal character set.

Converts input string of extern_type to output string of intern_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The state argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how state is used.

The result returned is a member of codecvt_base::result. If all the input is converted, returns codecvt_base::ok. If no conversion is necessary, returns codecvt_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt_base::partial. Otherwise the conversion failed and codecvt_base::error is returned.

Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

Returns

codecvt_base::result.

Definition at line 196 of file codecvt.h.

4.645.2.3 result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const [inline], [inherited]

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This is analogous to wcsrtombs. It does this by calling codecvt::do_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from_end) are converted and written to [to,to_end). from_next and to_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from_next and to_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

4.645.2.4 `result std::__codecvt_abstract_base< wchar_t, char, mbstate_t >::unshift (state_type & __state, extern_type * __to, extern_type * __to_end, extern_type * & __to_next) const` `[inline],[inherited]`

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

4.647.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>class std::codecvt_byname< _InternT, _ExternT, _StateT >
```

class codecvt_byname [22.2.1.6].

Definition at line 458 of file codecvt.h.

4.647.2 Member Function Documentation

4.647.2.1 `template<typename _InternT, typename _ExternT, typename _StateT > virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_out (state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * __from_next, extern_type * __to, extern_type * __to_end, extern_type * __to_next) const`
`[protected], [virtual], [inherited]`

Convert from internal to external character set.

Converts input string of intern_type to output string of extern_type. This function is a hook for derived classes to change the value returned.

See Also

out for more information.

Implements [std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >](#).

```
4.647.2.2 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::in ( state_type & __state, const extern_type * __from, const extern_type * __from_end,
    const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 196 of file `codecvt.h`.

```
4.647.2.3 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end,
    const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

```
4.647.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std:: __codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type
    *& __to_next ) const    [inline],[inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

Returns

`codecvt_base::result`.

Definition at line 155 of file `codecvt.h`.

4.648.1 Detailed Description

`template<typename _CharT> class std::collate<_CharT>`

Facet for localized string comparison.

This facet encapsulates the code to compare strings in a localized manner.

The collate template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the collate facet.

Definition at line 584 of file `locale_classes.h`.

4.648.2 Member Typedef Documentation

4.648.2.1 `template<typename _CharT> typedef _CharT std::collate<_CharT>::char_type`

Public typedefs.

Definition at line 590 of file `locale_classes.h`.

4.648.2.2 `template<typename _CharT> typedef basic_string<_CharT> std::collate<_CharT>::string_type`

Public typedefs.

Definition at line 591 of file `locale_classes.h`.

4.648.3 Constructor & Destructor Documentation

4.648.3.1 `template<typename _CharT> std::collate<_CharT>::collate(size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 611 of file locale_classes.h.

4.648.3.2 `template<typename _CharT> std::collate<_CharT>::collate (_c_locale __cloc, size_t __refs = 0)`
`[inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	Passed to the base facet class.

Definition at line 625 of file locale_classes.h.

4.648.3.3 `template<typename _CharT> virtual std::collate<_CharT>::~collate ()` `[inline], [protected], [virtual]`

Destructor.

Definition at line 688 of file locale_classes.h.

4.648.4 Member Function Documentation

4.648.4.1 `template<typename _CharT> int std::collate<_CharT>::compare (const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2) const` `[inline]`

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 642 of file locale_classes.h.

4.648.4.2 `template<typename _CharT> int std::collate<_CharT>::do_compare (const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2) const` `[protected], [virtual]`

Compare two strings.

This function is a hook for derived classes to change the value returned.

See Also

`compare()`.

Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 161 of file `locale_classes.tcc`.

References `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`, `std::basic_string<_CharT, _Traits, _Alloc>::data()`, and `std::basic_string<_CharT, _Traits, _Alloc>::length()`.

4.648.4.3 `template<typename _CharT> long std::collate<_CharT>::do_hash (const _CharT * __lo, const _CharT * __hi) const` `[protected]`, `[virtual]`

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Hash value.

Definition at line 256 of file `locale_classes.tcc`.

4.648.4.4 `template<typename _CharT> collate<_CharT>::string_type std::collate<_CharT>::do_transform (const _CharT * __lo, const _CharT * __hi) const` `[protected]`, `[virtual]`

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

Parameters

<code>__lo</code>	Start.
<code>__hi</code>	End.

Returns

transformed string.

Definition at line 200 of file `locale_classes.tcc`.

References `std::basic_string<_CharT, _Traits, _Alloc>::append()`, `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`, `std::basic_string<_CharT, _Traits, _Alloc>::data()`, `std::basic_string<_CharT, _Traits, _Alloc>::length()`, and `std::basic_string<_CharT, _Traits, _Alloc>::push_back()`.

4.648.4.5 `template<typename _CharT> long std::collate<_CharT>::hash (const _CharT * __lo, const _CharT * __hi) const` `[inline]`

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning `collate::do_hash()`.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Hash value.

Definition at line 675 of file `locale_classes.h`.

4.648.4.6 `template<typename _CharT> string_type std::collate<_CharT>::transform (const _CharT * __lo, const _CharT * __hi) const` `[inline]`

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

Returns

Transformed string_type.

Definition at line 661 of file `locale_classes.h`.

4.648.5 Member Data Documentation

4.648.5.1 `template<typename _CharT> locale::id std::collate<_CharT>::id` `[static]`

Numpunct facet id.

Definition at line 601 of file `locale_classes.h`.

4.659.1 Detailed Description

```
template<typename _CharT> class std::ctype<_CharT>
```

Primary class template ctype facet.

This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.

This template provides the protected virtual functions the developer will have to replace in a derived class or specialization to make a working facet. The public functions that access them are defined in `__ctype_abstract_base`, to allow for implementation flexibility. See `ctype<wchar_t>` for an example. The functions are documented in `__ctype_abstract_base`.

Note: implementations are provided for all the protected virtual functions, but will likely not be useful.

Definition at line 605 of file `locale_facets.h`.

4.659.2 Member Function Documentation

```
4.659.2.1 template<typename _CharT> virtual bool std::ctype<_CharT>::do_is ( mask __m, char_type __c ) const
        [protected], [virtual]
```

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to find the mask of.
<code>__m</code>	The mask to compare against.

Returns

$(M \& \text{__m}) \neq 0$.

Implements [std::__ctype_abstract_base<_CharT>](#).

```
4.659.2.2 template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_is ( const char_type * __lo,
        const char_type * __hi, mask * __vec ) const [protected], [virtual]
```

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
-------------------	----------------------------

<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.659.2.3 `template<typename _CharT> virtual char std::ctype<_CharT>::do_narrow (char_type __c, char __default) const [protected], [virtual]`

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `default` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

Returns

The converted `char`.

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::narrow()`.

4.659.2.4 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const [protected], [virtual]`

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.659.2.5 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_is (mask __m, const char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Find char_type matching mask.

This function searches for and returns the first char_type c in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching char_type if found, else `__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.659.2.6 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Find char_type not matching mask.

This function searches for and returns a pointer to the first char_type c of [`lo`,`hi`) for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else `__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.659.2.7 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_tolower (char_type __c) const` `[protected]`, `[virtual]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The lowercase `char_type` if convertible, else `__c`.

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::tolower()`.

4.659.2.8 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_tolower (char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.659.2.9 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_toupper (char_type __c) const` `[protected]`, `[virtual]`

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::toupper()`.

4.659.2.10 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_toupper (char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base< _CharT >](#).

4.659.2.11 `template<typename _CharT> virtual char_type std::ctype< _CharT >::do_widen (char __c) const`
`[protected], [virtual]`

Widen char.

This virtual function converts the `char` to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted `char_type`

Implements [std::__ctype_abstract_base< _CharT >](#).

Referenced by `std::ctype< char >::widen()`.

4.659.2.12 `template<typename _CharT> virtual const char* std::ctype< _CharT >::do_widen (const char * __lo, const char * __hi, char_type * __to) const`
`[protected], [virtual]`

Widen char array.

This function converts each `char` in the input to `char_type` using the simplest reasonable transformation.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.

<code>__to</code>	Pointer to the destination array.
-------------------	-----------------------------------

Returns

`__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

4.659.2.13 `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is(mask __m, char_type __c)`
`const [inline],[inherited]`

Test `char_type` classification.

This function finds a mask `M` for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__c</code>	The <code>char_type</code> to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0`.

Definition at line 162 of file `locale_facets.h`.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`.

4.659.2.14 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is(const char_type`
`* __lo, const char_type * __hi, mask * __vec) const [inline],[inherited]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 179 of file `locale_facets.h`.

4.659.2.15 `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow(char_type __c, char`
`__default) const [inline],[inherited]`

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `default` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file `locale_facets.h`.

Referenced by `std::time_put< _CharT, _Outlter >::put()`.

4.659.2.16 `template<typename _CharT> const char_type* std::__ctype_abstract_base< _CharT >::narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const` `[inline],[inherited]`

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, `default` is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __default, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 346 of file `locale_facets.h`.

4.659.2.17 `template<typename _CharT> const char_type* std::__ctype_abstract_base< _CharT >::scan_is (mask __m, const char_type * __lo, const char_type * __hi) const` `[inline],[inherited]`

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 195 of file `locale_facets.h`.

4.659.2.18 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not(mask __m, const char_type * __lo, const char_type * __hi) const [inline],[inherited]`

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file locale_facets.h.

4.659.2.19 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower(char_type __c) const [inline],[inherited]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase char_type if convertible, else `__c`.

Definition at line 254 of file locale_facets.h.

4.659.2.20 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower(char_type * __lo, const char_type * __hi) const [inline],[inherited]`

Convert array to lowercase.

This function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched. It does so by returning ctype<char_type>::do_tolower(__lo,__hi).

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file locale_facets.h.

4.659.2.21 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper (char_type __c)
const [inline],[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

4.659.2.22 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper (char_type
* __lo, const char_type * __hi) const [inline],[inherited]`

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file `locale_facets.h`.

4.659.2.23 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen (char __c) const
[inline],[inherited]`

Widen char to `char_type`.

This function converts the `char` argument to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted `char_type`.

Definition at line 286 of file `locale_facets.h`.

Referenced by `std::money_get<_CharT, _Inlter>::do_get()`, `std::time_put<_CharT, _Outlter>::do_put()`, `std::money_put<_CharT, _Outlter>::do_put()`, and `std::operator<<()`.

4.659.2.24 `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline], [inherited]`

Widen array to `char_type`.

This function converts each `char` in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 305 of file `locale_facets.h`.

4.659.3 Member Data Documentation

4.659.3.1 `template<typename _CharT> locale::id std::ctype<_CharT>::id` `[static]`

The facet id for `ctype<char_type>`

Definition at line 613 of file `locale_facets.h`.

The documentation for this class was generated from the following file:

4.660.1 Detailed Description

```
template<>class std::ctype< char >
```

The ctype<char> specialization.

This class defines classification and conversion functions for the char type. It gets used by char streams for many I/O operations. The char specialization provides a number of optimizations as well.

Definition at line 674 of file locale_facets.h.

4.660.2 Member Typedef Documentation

4.660.2.1 typedef char std::ctype< char >::char_type

Typedef for the template parameter char.

Definition at line 679 of file locale_facets.h.

4.660.3 Constructor & Destructor Documentation

4.660.3.1 std::ctype< char >::ctype (const mask * __table = 0, bool __del = false, size_t __refs = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__table</code>	If non-zero, table is used as the per-char mask. Else classic_table() is used.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

4.660.3.2 std::ctype< char >::ctype (__c_locale __cloc, const mask * __table = 0, bool __del = false, size_t __refs = 0) [explicit]

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__table</code>	If non-zero, table is used as the per-char mask.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

4.660.3.3 virtual std::ctype< char >::~ctype () [protected],[virtual]

Destructor.

This function deletes table() if del was true in the constructor.

4.660.4 Member Function Documentation

4.660.4.1 **static const mask* std::ctype< char >::classic_table () throw** [static]

Returns a pointer to the C locale mask table.

4.660.4.2 **virtual char std::ctype< char >::do_narrow (char_type __c, char __dfault) const** [inline],
[protected], [virtual]

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char to convert.
__dfault	Char to return if conversion fails.

Returns

The converted char.

Definition at line 1124 of file locale_facets.h.

4.660.4.3 **virtual const char_type* std::ctype< char >::do_narrow (const char_type * __lo, const char_type * __hi, char __dfault, char * __to) const** [inline], [protected], [virtual]

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__dfault	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 1150 of file locale_facets.h.

4.660.4.4 **virtual char_type std::ctype< char >::do_tolower (char_type __c) const** [protected], [virtual]

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

4.660.4.5 `virtual const char_type* std::ctype< char >::do_tolower (char_type * __lo, const char_type * __hi) const`
[protected], [virtual]

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

4.660.4.6 `virtual char_type std::ctype< char >::do_toupper (char_type __c) const` [protected], [virtual]

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

4.660.4.7 `virtual const char_type* std::ctype< char >::do_toupper (char_type * __lo, const char_type * __hi) const`
[protected], [virtual]

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do_toupper() is a hook for a derived facet to change the behavior of uppercasing. do_toupper() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

4.660.4.8 `virtual char_type std::ctype< char >::do_widen (char __c) const` `[inline]`, `[protected]`, `[virtual]`

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 1075 of file `locale_facets.h`.

4.660.4.9 `virtual const char* std::ctype< char >::do_widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline]`, `[protected]`, `[virtual]`

Widen char array.

This function converts each char in the range `[lo,hi)` to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be copied unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1098 of file `locale_facets.h`.

4.660.4.10 `bool std::ctype< char >::is (mask __m, char __c) const` `[inline]`

Test char classification.

This function compares the mask `table[c]` to `__m`.

Parameters

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file `ctype_inline.h`.

4.660.4.11 `const char * std::ctype< char >::is (const char * __lo, const char * __hi, mask * __vec) const` `[inline]`

Return a mask array.

This function finds the mask for each char in the range `[lo, hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

4.660.4.12 `char std::ctype< char >::narrow (char_type __c, char __dfault) const` `[inline]`

Narrow char.

This function converts the `char` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an undervived `ctype<char>` facet, `c` will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted character.

Definition at line 923 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_narrow()`.

4.660.4.13 `const char_type* std::ctype< char >::narrow (const char_type * __lo, const char_type * __hi, char __dfault, char * __to) const` `[inline]`

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_narrow(lo, hi, dfault, to). do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 956 of file locale_facets.h.

References std::ctype< _CharT >::do_narrow().

4.660.4.14 `const char * std::ctype< char >::scan_is (mask __m, const char * __lo, const char * __hi) const` [inline]

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching char if found, else `__hi`.

Definition at line 57 of file ctype_inline.h.

4.660.4.15 `const char * std::ctype< char >::scan_not (mask __m, const char * __lo, const char * __hi) const` [inline]

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [__lo,__hi) for which is(m,char) is false.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file ctype_inline.h.

4.660.4.16 `const mask* std::ctype< char >::table () const throw)` `[inline]`

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

Definition at line 974 of file `locale_facets.h`.

4.660.4.17 `char_type std::ctype< char >::tolower (char_type __c) const` `[inline]`

Convert to lowercase.

This function converts the `char` argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

Definition at line 828 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_tolower()`.

4.660.4.18 `const char_type* std::ctype< char >::tolower (char_type * __lo, const char_type * __hi) const` `[inline]`

Convert array to lowercase.

This function converts each `char` in the range `[lo,hi)` to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 845 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_tolower()`.

4.660.4.19 `char_type std::ctype< char >::toupper (char_type __c) const` `[inline]`

Convert to uppercase.

This function converts the `char` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`toupper()` acts as if it returns `ctype<char>::do_toupper(c)`. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

Definition at line 795 of file locale_facets.h.

References `std::ctype< _CharT >::do_toupper()`.

4.660.4.20 `const char_type* std::ctype< char >::toupper (char_type * __lo, const char_type * __hi) const`
`[inline]`

Convert array to uppercase.

This function converts each char in the range `[__lo,__hi)` to uppercase if possible. Other chars remain untouched.

`toupper()` acts as if it returns `ctype<char>::do_toupper(__lo, __hi)`. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 812 of file locale_facets.h.

References `std::ctype< _CharT >::do_toupper()`.

4.660.4.21 `char_type std::ctype< char >::widen (char __c) const` `[inline]`

Widen char.

This function converts the char to char_type using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 865 of file locale_facets.h.

References `std::ctype< _CharT >::do_widen()`.

4.660.4.22 `const char* std::ctype< char >::widen (const char * __lo, const char * __hi, char_type * __to) const`
`[inline]`

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 892 of file locale_facets.h.

References std::ctype<_CharT >::do_widen().

4.661.1 Detailed Description

```
template<>class std::ctype< wchar_t >
```

The ctype<wchar_t> specialization.

This class defines classification and conversion functions for the wchar_t type. It gets used by wchar_t streams for many I/O operations. The wchar_t specialization provides a number of optimizations as well.

ctype<wchar_t> inherits its public methods from __ctype_abstract_base<wchar_t>.

Definition at line 1175 of file locale_facets.h.

4.661.2 Member Typedef Documentation

4.661.2.1 typedef wchar_t std::ctype< wchar_t >::char_type

Typedef for the template parameter wchar_t.

Definition at line 1180 of file locale_facets.h.

4.661.3 Constructor & Destructor Documentation

4.661.3.1 std::ctype< wchar_t >::ctype (size_t __refs = 0) [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

4.661.3.2 std::ctype< wchar_t >::ctype (__c_locale __cloc, size_t __refs = 0) [explicit]

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__refs</code>	Passed to the base facet class.

4.661.3.3 virtual std::ctype< wchar_t >::~~ctype () [protected],[virtual]

Destructor.

4.661.4 Member Function Documentation

4.661.4.1 virtual bool std::ctype< wchar_t >::do_is (mask __m, char_type __c) const [protected],[virtual]

Test wchar_t classification.

This function finds a mask M for c and compares it to mask m.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>wchar_t</code> to find the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0.`

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.2 `virtual const char_type* std::ctype< wchar_t >::do_is (const char_type * __lo, const char_type * __hi, mask * __vec) const` [protected],[virtual]

Return a mask array.

This function finds the mask for each `wchar_t` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi.`

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.3 `virtual char std::ctype< wchar_t >::do_narrow (char_type __c, char __dfault) const` [protected],[virtual]

Narrow `wchar_t` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<wchar_t>` facet, `c` will be cast to `char` and returned.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted `char`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.4 `virtual const char_type* std::ctype< wchar_t >::do_narrow(const char_type * __lo, const char_type * __hi, char __default, char * __to) const` [protected], [virtual]

Narrow `wchar_t` array to `char` array.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `wchar_t` in the input that cannot be converted, `default` is used instead. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to `char`.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements `std::__ctype_abstract_base< wchar_t >`.

4.661.4.5 `virtual const char_type* std::ctype< wchar_t >::do_scan_is(mask __m, const char_type * __lo, const char_type * __hi) const` [protected], [virtual]

Find `wchar_t` matching mask.

This function searches for and returns the first `wchar_t` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching `wchar_t` if found, else `__hi`.

Implements `std::__ctype_abstract_base< wchar_t >`.

4.661.4.6 `virtual const char_type* std::ctype< wchar_t >::do_scan_not(mask __m, const char_type * __lo, const char_type * __hi) const` [protected], [virtual]

Find `wchar_t` not matching mask.

This function searches for and returns a pointer to the first `wchar_t` `c` of `[__lo,__hi)` for which `is(__m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching `wchar_t` if found, else `__hi`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.7 `virtual char_type std::ctype< wchar_t >::do_tolower (char_type __c) const` `[protected]`, `[virtual]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
------------------	--------------------------------------

Returns

The lowercase `wchar_t` if convertible, else `__c`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.8 `virtual const char_type* std::ctype< wchar_t >::do_tolower (char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Convert array to lowercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.9 `virtual char_type std::ctype< wchar_t >::do_toupper (char_type __c) const` `[protected]`, `[virtual]`

Convert to uppercase.

This virtual function converts the `wchar_t` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
------------------	--------------------------------------

Returns

The uppercase `wchar_t` if convertible, else `__c`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.10 `virtual const char_type* std::ctype< wchar_t >::do_toupper (char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`

Convert array to uppercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.11 `virtual char_type std::ctype< wchar_t >::do_widen (char __c) const` `[protected]`, `[virtual]`

Widen char to `wchar_t`.

This virtual function converts the char to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be cast to `wchar_t`.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted `wchar_t`.

Implements [std::__ctype_abstract_base< wchar_t >](#).

4.661.4.12 `virtual const char* std::ctype< wchar_t >::do_widen (const char * __lo, const char * __hi, char_type * __to) const` `[protected]`, `[virtual]`

Widen char array to `wchar_t` array.

This function converts each char in the input to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to `wchar_t`.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<wchar_t>](#).

4.661.4.13 `bool std::__ctype_abstract_base<wchar_t>::is (mask __m, char_type __c) const` `[inline]`,
`[inherited]`

Test char_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0`.

Definition at line 162 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_is()`.

4.661.4.14 `const char_type* std::__ctype_abstract_base<wchar_t>::is (const char_type * __lo, const char_type * __hi, mask * __vec) const` `[inline]`,`[inherited]`

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 179 of file locale_facets.h.

References `std::__ctype_abstract_base<_CharT>::do_is()`.

4.661.4.15 **char** **std::__ctype_abstract_base< wchar_t >::narrow (char_type __c, char __default) const** [inline], [inherited]

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__c	The char_type to convert.
__default	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file locale_facets.h.

References std::__ctype_abstract_base<_CharT>::do_narrow().

4.661.4.16 **const char_type*** **std::__ctype_abstract_base< wchar_t >::narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const** [inline], [inherited]

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __default, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

__lo	Pointer to start of range.
__hi	Pointer to end of range.
__default	Char to use if conversion fails.
__to	Pointer to the destination array.

Returns

__hi.

Definition at line 346 of file locale_facets.h.

References std::__ctype_abstract_base<_CharT>::do_narrow().

4.661.4.17 **const char_type*** **std::__ctype_abstract_base< wchar_t >::scan_is (mask __m, const char_type * __lo, const char_type * __hi) const** [inline], [inherited]

Find char_type matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 195 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_scan_is()`.

4.661.4.18 `const char_type* std::__ctype_abstract_base<wchar_t>::scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` `[inline]`, `[inherited]`

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_scan_not()`.

4.661.4.19 `char_type std::__ctype_abstract_base<wchar_t>::tolower (char_type __c) const` `[inline]`, `[inherited]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_tolower()`.

4.661.4.20 `const char_type* std::__ctype_abstract_base<wchar_t>::tolower (char_type * __lo, const char_type * __hi) const` `[inline]`, `[inherited]`

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo, __hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_tolower()`.

4.661.4.21 `char_type std::__ctype_abstract_base<wchar_t>::toupper (char_type __c) const` `[inline]`,
`[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_toupper()`.

4.661.4.22 `const char_type* std::__ctype_abstract_base<wchar_t>::toupper (char_type * __lo, const char_type * __hi) const` `[inline]`, `[inherited]`

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_toupper()`.

4.661.4.23 `char_type std::__ctype_abstract_base<wchar_t>::widen (char __c) const` `[inline]`, `[inherited]`

Widen char to `char_type`.

This function converts the `char` argument to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_widen().

4.661.4.24 `const char* std::__ctype_abstract_base< wchar_t >::widen (const char * __lo, const char * __hi, char_type * __to) const` `[inline]`, `[inherited]`

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning ctype<char_type>::do_widen(c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 305 of file locale_facets.h.

References std::__ctype_abstract_base< _CharT >::do_widen().

4.663.1 Detailed Description

```
template<typename _CharT>class std::ctype_byname< _CharT >
```

class [ctype_byname](#) [22.2.1.2].

Definition at line 1467 of file [locale_facets.h](#).

4.663.2 Member Function Documentation

4.663.2.1 `template<typename _CharT> virtual bool std::ctype<_CharT>::do_is (mask __m, char_type __c) const`
`[protected], [virtual], [inherited]`

Test char_type classification.

This function finds a mask M for *c* and compares it to mask *m*.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

<code>__c</code>	The char_type to find the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0.`

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.2 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_is (const char_type * __lo, const char_type * __hi, mask * __vec) const` `[protected], [virtual], [inherited]`

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do_is() is a hook for a derived facet to change the behavior of classifying. do_is() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi.`

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.3 `template<typename _CharT> virtual char std::ctype<_CharT>::do_narrow (char_type __c, char __dfault) const`
`[protected], [virtual], [inherited]`

Narrow char_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__default</code>	Char to return if conversion fails.

Returns

The converted char.

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::narrow()`.

4.663.2.4 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_narrow (const char_type* __lo, const char_type* __hi, char __default, char* __to) const` [protected], [virtual], [inherited]

Narrow `char_type` array to `char`.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.5 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_is (mask __m, const char_type* __lo, const char_type* __hi) const` [protected], [virtual], [inherited]

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a matching `char_type` if found, else `__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.6 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` [protected], [virtual], [inherited]

Find char_type not matching mask.

This function searches for and returns a pointer to the first char_type c of [lo,hi) for which is(m,c) is false.

do_scan_is() is a hook for a derived facet to change the behavior of match searching. do_is() must always return the same result for the same input.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

Pointer to a non-matching char_type if found, else `__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.7 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_tolower (char_type __c) const` [protected], [virtual], [inherited]

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

Returns

The lowercase char_type if convertible, else `__c`.

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::tolower()`.

4.663.2.8 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_tolower (char_type * __lo, const char_type * __hi) const` [protected], [virtual], [inherited]

Convert array to lowercase.

This virtual function converts each char_type in the range [__lo,__hi) to lowercase if possible. Other elements remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.9 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_toupper (char_type __c) const`
`[protected], [virtual], [inherited]`

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::toupper()`.

4.663.2.10 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_toupper (char_type * __lo,`
`const char_type * __hi) const` `[protected], [virtual], [inherited]`

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.11 `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_widen (char __c) const`
`[protected], [virtual], [inherited]`

Widen char.

This virtual function converts the char to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type

Implements [std::__ctype_abstract_base<_CharT>](#).

Referenced by `std::ctype<char>::widen()`.

4.663.2.12 `template<typename _CharT> virtual const char* std::ctype<_CharT>::do_widen (const char * __lo, const char * __hi, char_type * __to) const` `[protected]`, `[virtual]`, `[inherited]`

Widen char array.

This function converts each char in the input to char_type using the simplest reasonable transformation.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Implements [std::__ctype_abstract_base<_CharT>](#).

4.663.2.13 `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is (mask __m, char_type __c) const` `[inline]`, `[inherited]`

Test char_type classification.

This function finds a mask M for __c and compares it to mask __m. It does so by returning the value of `ctype<char_type>::do_is()`.

Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

`(M & __m) != 0`.

Definition at line 162 of file `locale_facets.h`.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`.

4.663.2.14 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is (const char_type
* __lo, const char_type * __hi, mask * __vec) const [inline],[inherited]`

Return a mask array.

This function finds the mask for each char_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char_type>::do_is().

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 179 of file locale_facets.h.

4.663.2.15 `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow (char_type __c, char
__default) const [inline],[inherited]`

Narrow char_type to char.

This function converts the char_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char_type>::do_narrow(__c).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 324 of file locale_facets.h.

Referenced by std::time_put<_CharT, _OutIter>::put().

4.663.2.16 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow (const
char_type * __lo, const char_type * __hi, char __default, char * __to) const [inline],[inherited]`

Narrow array to char array.

This function converts each char_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char_type>::do_narrow(__lo, __hi, __default, __to).

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns`__hi`.

Definition at line 346 of file locale_facets.h.

4.663.2.17 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is (mask __m, const char_type * __lo, const char_type * __hi) const` `[inline]`, `[inherited]`

Find char_type matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char_type>::do_scan_is().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

ReturnsPointer to matching char_type if found, else `__hi`.

Definition at line 195 of file locale_facets.h.

4.663.2.18 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not (mask __m, const char_type * __lo, const char_type * __hi) const` `[inline]`, `[inherited]`

Find char_type not matching a mask.

This function searches for and returns the first char_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char_type>::do_scan_not().

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

ReturnsPointer to non-matching char if found, else `__hi`.

Definition at line 211 of file locale_facets.h.

4.663.2.19 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower (char_type __c) const` `[inline]`, `[inherited]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char_type>::do_tolower(c).

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

```
4.663.2.20  template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower ( char_type
            * __lo, const char_type * __hi ) const    [inline],[inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 269 of file `locale_facets.h`.

```
4.663.2.21  template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper ( char_type __c )
            const    [inline],[inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

```
4.663.2.22  template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper ( char_type
            * __lo, const char_type * __hi ) const    [inline],[inherited]
```

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 240 of file locale_facets.h.

4.663.2.23 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen (char __c) const`
`[inline], [inherited]`

Widen char to char_type.

This function converts the char argument to char_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted char_type.

Definition at line 286 of file locale_facets.h.

Referenced by `std::money_get<_CharT, _InIter >::do_get()`, `std::time_put<_CharT, _OutIter >::do_put()`, `std::money_put<_CharT, _OutIter >::do_put()`, and `std::operator<<()`.

4.663.2.24 `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen (const char * __lo, const char * __hi, char_type * __to) const`
`[inline], [inherited]`

Widen array to char_type.

This function converts each char in the input to char_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 305 of file locale_facets.h.

4.663.3 Member Data Documentation

4.663.3.1 `template<typename _CharT> locale::id std::ctype<_CharT>::id` `[static], [inherited]`

The facet id for `ctype<char_type>`

Definition at line 613 of file `locale_facets.h`.

4.664.1 Detailed Description

```
template<>class std::ctype_byname< char >
```

22.2.1.4 Class `ctype_byname` specializations.

Definition at line 1482 of file `locale_facets.h`.

4.664.2 Member Typedef Documentation

4.664.2.1 `typedef char` **`std::ctype< char >::char_type`** `[inherited]`

Typedef for the template parameter `char`.

Definition at line 679 of file `locale_facets.h`.

4.664.3 Member Function Documentation

4.664.3.1 `static const mask*` **`std::ctype< char >::classic_table () throw`** `[static],[inherited]`

Returns a pointer to the C locale mask table.

4.664.3.2 `virtual char` **`std::ctype< char >::do_narrow (char_type __c, char __dfault) const`** `[inline],[protected],[virtual],[inherited]`

Narrow `char`.

This virtual function converts the `char` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<char>` facet, `c` will be returned unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The <code>char</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted char.

Definition at line 1124 of file locale_facets.h.

4.664.3.3 virtual const char_type* std::ctype< char >::do_narrow (const char_type * __lo, const char_type * __hi, char __default, char * __to) const [inline], [protected], [virtual], [inherited]

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *default* is used instead. For an undervived ctype<char> facet, the argument will be copied unchanged.

do_narrow() is a hook for a derived facet to change the behavior of narrowing. do_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1150 of file locale_facets.h.

4.664.3.4 virtual char_type std::ctype< char >::do_tolower (char_type __c) const [protected], [virtual], [inherited]

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

4.664.3.5 virtual const char_type* std::ctype< char >::do_tolower (char_type * __lo, const char_type * __hi) const [protected], [virtual], [inherited]

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do_tolower() is a hook for a derived facet to change the behavior of lowercasing. do_tolower() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

4.664.3.6 `virtual char_type std::ctype< char >::do_toupper (char_type __c) const` `[protected]`, `[virtual]`, `[inherited]`

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

4.664.3.7 `virtual const char_type* std::ctype< char >::do_toupper (char_type * __lo, const char_type * __hi) const` `[protected]`, `[virtual]`, `[inherited]`

Convert array to uppercase.

This virtual function converts each char in the range `[lo,hi)` to uppercase if possible. Other chars remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

4.664.3.8 `virtual char_type std::ctype< char >::do_widen (char __c) const` `[inline]`, `[protected]`, `[virtual]`, `[inherited]`

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 1075 of file locale_facets.h.

4.664.3.9 `virtual const char* std::ctype< char >::do_widen (const char * __lo, const char * __hi, char_type * __to) const`
`[inline], [protected], [virtual], [inherited]`

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an undervied ctype<char> facet, the argument will be copied unchanged.

do_widen() is a hook for a derived facet to change the behavior of widening. do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 1098 of file locale_facets.h.

4.664.3.10 `bool std::ctype< char >::is (mask __m, char __c) const` `[inline], [inherited]`

Test char classification.

This function compares the mask table[c] to `__m`.

Parameters

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

Returns

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file ctype_inline.h.

4.664.3.11 `const char * std::ctype< char >::is (const char * __lo, const char * __hi, mask * __vec) const` `[inline], [inherited]`

Return a mask array.

This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

Returns

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

4.664.3.12 `char std::ctype<char>::narrow (char_type __c, char __dfault) const` `[inline],[inherited]`

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived `ctype<char>` facet, *c* will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

Returns

The converted character.

Definition at line 923 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_narrow()`.

4.664.3.13 `const char_type* std::ctype<char>::narrow (const char_type * __lo, const char_type * __hi, char __dfault, char * __to) const` `[inline],[inherited]`

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_narrow(lo, hi, dfault, to)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

Returns`__hi`.

Definition at line 956 of file locale_facets.h.

References std::ctype< _CharT >::do_narrow().

4.664.3.14 `const char * std::ctype< char >::scan_is (mask __m, const char * __lo, const char * __hi) const` `[inline]`,
`[inherited]`

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

ReturnsPointer to a matching char if found, else `__hi`.

Definition at line 57 of file ctype_inline.h.

4.664.3.15 `const char * std::ctype< char >::scan_not (mask __m, const char * __lo, const char * __hi) const` `[inline]`,
`[inherited]`

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [__lo,__hi) for which is(m,char) is false.

Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

ReturnsPointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file ctype_inline.h.

4.664.3.16 `const mask* std::ctype< char >::table () const throw` `[inline]`, `[inherited]`

Returns a pointer to the mask table provided to the constructor, or the default from classic_table() if none was provided.

Definition at line 974 of file locale_facets.h.

4.664.3.17 `char_type std::ctype< char >::tolower (char_type __c) const` `[inline]`, `[inherited]`

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument. tolower() acts as if it returns ctype<char>::do_tolower(__c). do_tolower() must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The lowercase char if convertible, else `__c`.

Definition at line 828 of file locale_facets.h.

References std::ctype<_CharT>::do_tolower().

4.664.3.18 `const char_type* std::ctype<char>::tolower (char_type * __lo, const char_type * __hi) const` `[inline], [inherited]`

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

tolower() acts as if it returns ctype<char>::do_tolower(__lo, __hi). do_tolower() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 845 of file locale_facets.h.

References std::ctype<_CharT>::do_tolower().

4.664.3.19 `char_type std::ctype<char>::toupper (char_type __c) const` `[inline], [inherited]`

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype<char>::do_toupper(c). do_toupper() must always return the same result for the same input.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The uppercase char if convertible, else `__c`.

Definition at line 795 of file locale_facets.h.

References std::ctype<_CharT>::do_toupper().

4.664.3.20 `const char_type* std::ctype< char >::toupper (char_type * __lo, const char_type * __hi) const`
`[inline], [inherited]`

Convert array to uppercase.

This function converts each char in the range [__lo,__hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype<char>::do_toupper(__lo, __hi). do_toupper() must always return the same result for the same input.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

Returns

`__hi`.

Definition at line 812 of file locale_facets.h.

References std::ctype<_CharT>::do_toupper().

4.664.3.21 `char_type std::ctype< char >::widen (char __c) const` `[inline], [inherited]`

Widen char.

This function converts the char to char_type using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

Returns

The converted character.

Definition at line 865 of file locale_facets.h.

References std::ctype<_CharT>::do_widen().

4.664.3.22 `const char* std::ctype< char >::widen (const char * __lo, const char * __hi, char_type * __to) const`
`[inline], [inherited]`

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do_widen(c). do_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

Returns

`__hi`.

Definition at line 892 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_widen()`.

4.664.4 Member Data Documentation

4.664.4.1 `locale::id std::ctype<char>::id` `[static]`, `[inherited]`

The facet id for `ctype<char>`

Definition at line 696 of file `locale_facets.h`.

4.664.4.2 `const size_t std::ctype<char>::table_size` `[static]`, `[inherited]`

The size of the mask table. It is `SCHAR_MAX + 1`.

Definition at line 698 of file `locale_facets.h`.

- void [operator\(\)](#) (_Tp *__ptr) const

4.668.1 Detailed Description

```
template<typename _Tp>struct std::default_delete<_Tp>
```

Primary template of default_delete, used by unique_ptr.

Definition at line 54 of file unique_ptr.h.

4.668.2 Constructor & Destructor Documentation

4.668.2.1 `template<typename _Tp> constexpr std::default_delete<_Tp>::default_delete () [default], [noexcept]`

Default constructor.

4.668.2.2 `template<typename _Tp> template<typename _Up, typename = typename enable_if<is_convertible<_Up*,
_Tp*>::value>::type> std::default_delete<_Tp>::default_delete (const default_delete<_Up> &)
[inline], [noexcept]`

Converting constructor.

Allows conversion from a deleter for arrays of another type, `_Up`, only if `_Up*` is convertible to `_Tp*`.

Definition at line 66 of file `unique_ptr.h`.

4.668.3 Member Function Documentation

4.668.3.1 `template<typename _Tp> void std::default_delete<_Tp>::operator() (_Tp * __ptr) const [inline]`

Calls `delete __ptr`.

Definition at line 70 of file `unique_ptr.h`.

The documentation for this struct was generated from the following file:

- [unique_ptr.h](#)

4.669 `std::default_delete<_Tp[]>` Struct Template Reference

Public Member Functions

- constexpr [default_delete](#) () noexcept=default
- `template<typename _Up, typename = typename enable_if<!__is_derived_Tp<_Up>::value>::type>
default_delete (const default_delete<_Up[]> &) noexcept`
- void [operator\(\)](#) (_Tp * __ptr) const
- `template<typename _Up>
enable_if<__is_derived_Tp
<_Up>::value>::type operator\(\) (_Up *) const =delete`

4.669.1 Detailed Description

`template<typename _Tp> struct std::default_delete<_Tp[]>`

Specialization for arrays, `default_delete`.

Definition at line 84 of file `unique_ptr.h`.

4.669.2 Constructor & Destructor Documentation

4.669.2.1 `template<typename _Tp> constexpr std::default_delete<_Tp[]>::default_delete () [default],
[noexcept]`

Default constructor.

4.669.2.2 `template<typename _Tp> template<typename _Up, typename = typename enable_if<!__is_derived_Tp<_
_Up>::value>::type> std::default_delete<_Tp[]>::default_delete (const default_delete<_Up[]> &)
[inline], [noexcept]`

Converting constructor.

Allows conversion from a deleter for arrays of another type, such as a const-qualified version of `_Tp`.

Conversions from types derived from `_Tp` are not allowed because it is unsafe to `delete[]` an array of derived types through a pointer to the base type.

Definition at line 111 of file `unique_ptr.h`.

4.669.3 Member Function Documentation

4.671.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>>class std::deque< _Tp, _Alloc >`

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#).

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a `deque<Tp>` manages memory. Each deque has 4 members:

- `Tp** _M_map`

- `size_t _M_map_size`
- `iterator _M_start, _M_finish`

`map_size` is at least 8. `map` is an array of `map_size` pointers-to-*nodes*. (The name `map` has nothing to do with the `std::map` class, and **nodes** should not be confused with `std::list`'s usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-Tp. If Tp is very large, there will be one Tp element per node (i.e., an *array* of one). For non-huge Tp's, node size is inversely related to Tp size: the larger the Tp, the fewer Tp's will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different Tp's, to improve allocator efficiency.

Not every pointer in the `map` array will point to a node. If the initial number of elements in the deque is small, the /middle/ `map` pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the `map` grows: available `map` pointers, if any, will be on the ends. As new nodes are created, only a subset of the `map`'s pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator `i`:
 - `i.node` points to a member of the `map` array. (Yes, you read that correctly: `i.node` does not actually point to a node.) The member of the `map` array is what actually points to the node.
 - `i.first == *(i.node)` (This points to the node (first Tp element).)
 - `i.last == i.first + node_size`
 - `i.cur` is a pointer in the range `[i.first, i.last)`. NOTE: the implication of this is that `i.cur` is always a dereferenceable pointer, even if `i` is a past-the-end iterator.
- `Start` and `Finish` are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with $<N$ elements (where N is the node buffer size) must have one node, a deque with N through $(2N-1)$ elements must have two nodes, etc.
- For every node other than `start.node` and `finish.node`, every element in the node is an initialized object. If `start.node == finish.node`, then `[start.cur, finish.cur)` are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, `[start.cur, start.last)` and `[finish.first, finish.cur)` are initialized objects, and `[start.first, start.cur)` and `[finish.cur, finish.last)` are uninitialized storage.
- `[map, map + map_size)` is a valid, non-empty range.
- `[start.node, finish.node]` is a valid range contained within `[map, map + map_size)`.
- A pointer in the range `[map, map + map_size)` points to an allocated node if and only if the pointer is in the range `[start.node, finish.node]`.

Here's the magic: nothing in deque is **aware** of the discontinuous storage!

The memory setup and layout occurs in the parent, `_Base`, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the `start` and `finish` iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

Definition at line 735 of file `stl_deque.h`.

4.671.2 Constructor & Destructor Documentation

4.671.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (size_type __n, const value_type & __value, const allocator_type & __a = allocator_type()) [inline]`

Creates a deque with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the deque with `__n` copies of `__value`.

Definition at line 813 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::_M_fill_initialize()`.

4.671.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (const deque< _Tp, _Alloc > &__x) [inline]`

Deque copy constructor.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The newly-created deque uses a copy of the allocation object used by `__x`.

Definition at line 840 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::begin()`, and `std::deque< _Tp, _Alloc >::end()`.

4.671.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (deque< _Tp, _Alloc > && __x) [inline]`

Deque move constructor.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The newly-created deque contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified deque.

Definition at line 854 of file `stl_deque.h`.

4.671.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::deque (initializer_list< value_type > __l, const allocator_type & __a = allocator_type()) [inline]`

Builds a deque from an initializer list.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements in the `initializer_list __l`.

This will call the element type's copy constructor `N` times (where `N` is `__l.size()`) and do no memory reallocation.

Definition at line 868 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::_M_range_initialize()`.

4.671.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> std::deque< _Tp, _Alloc >::deque (_InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type()) [inline]`

Builds a deque from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements from [`__first`, `__last`).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is `distance(__first, __last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 895 of file `stl_deque.h`.

4.671.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::~~deque ()`
`[inline], [noexcept]`

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 916 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`, and `std::deque<_Tp, _Alloc>::end()`.

4.671.3 Member Function Documentation

4.671.3.1 `template<typename _Tp, typename _Alloc> void deque::_M_fill_initialize (const value_type & __value)`
`[protected]`

Fills the deque with copies of `value`.

Parameters

<code>__value</code>	Initial value.
----------------------	----------------

Returns

Nothing.

Precondition

`_M_start` and `_M_finish` have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

Definition at line 356 of file `deque.tcc`.

References `std::_Destroy()`.

Referenced by `std::deque<_Tp, _Alloc>::deque()`.

4.671.3.2 `template<typename _Tp, typename _Alloc> void std::_Deque_base<_Tp, _Alloc>::_M_initialize_map (size_t __num_elements)`
`[protected], [inherited]`

Layout storage.

Parameters

<code>__num_elements</code>	The count of T's for which to allocate space at first.
-----------------------------	--

Returns

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 587 of file `std_deque.h`.

References `std::max()`.

4.671.3.3 `template<typename _Tp, typename _Alloc > void deque::_M_new_elements_at_back (size_type __new_elements)`
[protected]

Memory-handling helpers for the previous internal insert functions.

Definition at line 854 of file `deque.tcc`.

References `std::size()`.

Referenced by `std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back()`.

4.671.3.4 `template<typename _Tp, typename _Alloc > void deque::_M_new_elements_at_front (size_type __new_elements)`
[protected]

Memory-handling helpers for the previous internal insert functions.

Definition at line 829 of file `deque.tcc`.

References `std::size()`.

Referenced by `std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front()`.

4.671.3.5 `template<typename _Tp, typename _Alloc > void deque::_M_pop_back_aux ()` [protected]

Helper functions for `push_*` and `pop_*`.

Definition at line 510 of file `deque.tcc`.

Referenced by `std::deque< _Tp, _Alloc >::pop_back()`.

4.671.3.6 `template<typename _Tp, typename _Alloc > void deque::_M_pop_front_aux ()` [protected]

Helper functions for `push_*` and `pop_*`.

Definition at line 525 of file `deque.tcc`.

Referenced by `std::deque< _Tp, _Alloc >::pop_front()`.

4.671.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> void std::deque<`
`_Tp, _Alloc >::_M_push_back_aux (_Args &&... __args)` [protected]

Helper functions for `push_*` and `pop_*`.

Referenced by `std::deque< _Tp, _Alloc >::push_back()`.

4.671.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> void std::deque<`
`_Tp, _Alloc >::_M_push_front_aux (_Args &&... __args)` [protected]

Helper functions for `push_*` and `pop_*`.

Referenced by `std::deque< _Tp, _Alloc >::push_front()`.

4.671.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_range_check (size_type __n) const [inline], [protected]`

Safety check used only from `at()`.

Definition at line 1264 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::size()`.

Referenced by `std::deque< _Tp, _Alloc >::at()`.

4.671.3.10 `template<typename _Tp, typename _Alloc > template<typename _InputIterator > void deque::_M_range_initialize (_InputIterator __first, _InputIterator __last, std::input_iterator_tag) [protected]`

Fills the deque with whatever is in `[first,last)`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

Definition at line 382 of file `deque.tcc`.

Referenced by `std::deque< _Tp, _Alloc >::deque()`.

4.671.3.11 `template<typename _Tp, typename _Alloc > template<typename _ForwardIterator > void deque::_M_range_initialize (_ForwardIterator __first, _ForwardIterator __last, std::forward_iterator_tag) [protected]`

Fills the deque with whatever is in `[first,last)`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

Definition at line 406 of file `deque.tcc`.

References `std::_Destroy()`, `std::advance()`, and `std::distance()`.

4.671.3.12 `template<typename _Tp, typename _Alloc > void deque::_M_reallocate_map (size_type __nodes_to_add, bool __add_at_front) [protected]`

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Definition at line 879 of file deque.tcc.

References std::max().

Referenced by std::deque< _Tp, _Alloc >::_M_reserve_map_at_back(), and std::deque< _Tp, _Alloc >::_M_reserve_map_at_front().

4.671.3.13 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_back(size_type __n) [inline], [protected]`

Memory-handling helpers for the previous internal insert functions.

Definition at line 1964 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_new_elements_at_back().

4.671.3.14 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front(size_type __n) [inline], [protected]`

Memory-handling helpers for the previous internal insert functions.

Definition at line 1954 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_new_elements_at_front().

4.671.3.15 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_reserve_map_at_back(size_type __nodes_to_add = 1) [inline], [protected]`

Memory-handling helpers for the major map.

Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)

Definition at line 1990 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_reallocate_map().

4.671.3.16 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_reserve_map_at_front(size_type __nodes_to_add = 1) [inline], [protected]`

Memory-handling helpers for the major map.

Makes sure the _M_map has space for new nodes. Does not actually add the nodes. Can invalidate _M_map pointers. (And consequently, deque iterators.)

Definition at line 1998 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::_M_reallocate_map().

4.671.3.17 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::assign (size_type __n, const value_type & __val) [inline]`

Assigns a given value to a deque.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a deque with *n* copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 977 of file stl_deque.h.

Referenced by `std::deque<_Tp, _Alloc>::assign()`, and `std::deque<_Tp, _Alloc>::operator=()`.

4.671.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::deque<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a deque.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a deque with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 996 of file `stl_deque.h`.

4.671.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::assign (initializer_list<value_type> __l) [inline]`

Assigns an initializer list to a deque.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a deque with copies of the elements in the initializer_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 1021 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::assign()`.

4.671.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::at (size_type __n) [inline]`

Provides access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read/write reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1286 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_range_check()`.

4.671.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::at (`
`size_type __n) const [inline]`

Provides access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read-only (constant) reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1304 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_range_check()`.

4.671.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::back ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the last element of the deque.

Definition at line 1331 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::end()`.

4.671.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::back () const`
`[inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the deque.

Definition at line 1343 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::end()`.

4.671.3.24 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::begin ()`
`[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1036 of file `stl_deque.h`.

Referenced by `std::deque<_Tp, _Alloc>::clear()`, `std::deque<_Tp, _Alloc>::deque()`, `std::deque<_Tp, _Alloc>::front()`, `std::deque<_Tp, _Alloc>::insert()`, `std::deque<_Tp, _Alloc>::operator=()`, `std::operator==()`, and `std::deque<_Tp, _Alloc>::~~deque()`.

4.671.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::begin () const`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1044 of file `stl_deque.h`.

4.671.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::cbegin () const`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1107 of file `stl_deque.h`.

Referenced by std::deque< _Tp, _Alloc >::insert().

4.671.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1116 of file stl_deque.h.

4.671.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::clear () [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1676 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin().

Referenced by std::deque< _Tp, _Alloc >::operator=().

4.671.3.29 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1125 of file stl_deque.h.

4.671.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1134 of file stl_deque.h.

4.671.3.31 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator std::deque< _Tp, _Alloc >::emplace (const_iterator __position, _Args &&... __args)`

Inserts an object in deque before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location.

Referenced by std::deque< _Tp, _Alloc >::insert().

4.671.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::deque< _Tp, _Alloc >::empty () const [inline], [noexcept]`

Returns true if the deque is empty. (Thus begin() would equal end().)

Definition at line 1227 of file `stl_deque.h`.

4.671.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1053 of file `stl_deque.h`.

Referenced by `std::deque<_Tp, _Alloc>::back()`, `std::deque<_Tp, _Alloc>::deque()`, `std::deque<_Tp, _Alloc>::operator=()`, `std::operator==()`, and `std::deque<_Tp, _Alloc>::~~deque()`.

4.671.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::end () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1062 of file `stl_deque.h`.

4.671.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::front ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the first element of the deque.

Definition at line 1315 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`.

4.671.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::front () const` `[inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the deque.

Definition at line 1323 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`.

4.671.3.37 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::deque<_Tp, _Alloc>::get_allocator () const` `[inline], [noexcept]`

Get a copy of the memory allocation object.

Definition at line 1027 of file `stl_deque.h`.

4.671.3.38 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert (const_iterator __position, const value_type & __x)`

Inserts given value into deque before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

Referenced by std::deque< _Tp, _Alloc >::insert(), and std::deque< _Tp, _Alloc >::resize().

4.671.3.39 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::insert (const_iterator __position, value_type && __x) [inline]`

Inserts given rvalue into deque before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

Definition at line 1506 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::emplace().

4.671.3.40 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::insert (const_iterator __p, initializer_list< value_type > __l) [inline]`

Inserts an initializer list into the deque.

Parameters

<code>__p</code>	An iterator into the deque.
<code>__l</code>	An initializer_list.

This function will insert copies of the data in the initializer_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

Definition at line 1519 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::insert().

4.671.3.41 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::insert (const_iterator __position, size_type __n, const value_type & __x) [inline]`

Inserts a number of copies of given data into the deque.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

Definition at line 1535 of file stl_deque.h.

References std::deque< _Tp, _Alloc >::begin(), and std::deque< _Tp, _Alloc >::cbegin().

4.671.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> iterator std::deque<_Tp, _Alloc>::insert(const_iterator __position, _InputIterator __first, _InputIterator __last) [inline]`

Inserts a range into the deque.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the deque before the location specified by `__position`. This is known as *range insert*.

Definition at line 1571 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::begin()`, and `std::deque< _Tp, _Alloc >::cbegin()`.

4.671.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque< _Tp, _Alloc >::max_size () const [inline], [noexcept]`

Returns the `size()` of the largest possible deque.

Definition at line 1146 of file `stl_deque.h`.

4.671.3.44 `template<typename _Tp, typename _Alloc > deque< _Tp, _Alloc > & deque::operator= (const deque< _Tp, _Alloc > & __x)`

Deque assignment operator.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

All the elements of `x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 93 of file `deque.tcc`.

References `std::deque< _Tp, _Alloc >::begin()`, `std::deque< _Tp, _Alloc >::end()`, `std::deque< _Tp, _Alloc >::size()`, and `std::size()`.

4.671.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque< _Tp, _Alloc >::operator= (deque< _Tp, _Alloc > && __x) [inline], [noexcept]`

Deque move assignment operator.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this deque (without copying). `__x` is a valid, but unspecified deque.

Definition at line 938 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::clear()`, and `std::deque< _Tp, _Alloc >::swap()`.

4.671.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque< _Tp, _Alloc >::operator= (initializer_list< value_type > __l) [inline]`

Assigns an initializer list to a deque.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a deque with copies of the elements in the initializer_list `__l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 959 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::assign()`.

4.671.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::operator[] (size_type __n) [inline], [noexcept]`

Subscript access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1243 of file `stl_deque.h`.

4.671.3.48 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::operator[] (size_type __n) const [inline], [noexcept]`

Subscript access to the data contained in the deque.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1258 of file `stl_deque.h`.

4.671.3.49 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::pop_back () [inline], [noexcept]`

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1444 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_pop_back_aux()`.

4.671.3.50 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::pop_front ()`
`[inline], [noexcept]`

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1423 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_pop_front_aux()`.

4.671.3.51 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::push_back (`
`const value_type &__x) [inline]`

Add data to the end of the deque.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1392 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_push_back_aux()`.

4.671.3.52 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::push_front (`
`const value_type &__x) [inline]`

Add data to the front of the deque.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1361 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_push_front_aux()`.

4.671.3.53 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque<_Tp, _Alloc>`
`>::rbegin () [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1071 of file `stl_deque.h`.

4.671.3.54 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp,`
`_Alloc>::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1080 of file `stl_deque.h`.

4.671.3.55 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque<_Tp, _Alloc>::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1089 of file `stl_deque.h`.

4.671.3.56 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1098 of file `stl_deque.h`.

4.671.3.57 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::resize (size_type __new_size) [inline]`

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
-------------------------	--

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

Definition at line 1160 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::size()`.

4.671.3.58 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::resize (size_type __new_size, const value_type & __x) [inline]`

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

Definition at line 1182 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::insert()`, and `std::deque<_Tp, _Alloc>::size()`.

4.671.3.59 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::shrink_to_fit () [inline], [noexcept]`

A non-binding request to reduce memory use.

Definition at line 1218 of file `stl_deque.h`.

4.671.3.60 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque<_Tp, _Alloc>::size () const [inline], [noexcept]`

Returns the number of elements in the deque.

Definition at line 1141 of file `stl_deque.h`.

Referenced by `std::deque<_Tp, _Alloc>::M_range_check()`, `std::deque<_Tp, _Alloc>::operator=()`, `std-`

::operator==(), and std::deque< _Tp, _Alloc >::resize().

4.671.3.61 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::swap (deque< _Tp, _Alloc > & __x) [inline], [noexcept]`

Swaps data with another deque.

Parameters

<code>__x</code>	A deque of the same element and allocator types.
------------------	--

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(d1,d2) will feed to this function.

Definition at line 1656 of file stl_deque.h.

References std::swap().

Referenced by std::deque< _Tp, _Alloc >::operator==(), and std::swap().

4.671.4 Member Data Documentation

4.671.4.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::__pad0 [explicit]`

Creates a deque with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 803 of file stl_deque.h.

4.671.4.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque< _Tp, _Alloc >::iterator`

Remove element at given position.

Remove a range of elements.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1620 of file `stl_deque.h`.

4.672.1 Detailed Description

`template<typename _RandomNumberEngine, size_t __p, size_t __r>class std::discard_block_engine<_RandomNumberEngine, __p, __r>`

Produces random numbers from some base engine by discarding blocks of data.

`0 <= __r <= __p`

Definition at line 854 of file `random.h`.

4.672.2 Member Typedef Documentation

4.672.2.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> typedef _RandomNumberEngine::result_type`
`std::discard_block_engine<_RandomNumberEngine, __p, __r>::result_type`

The type of the generated random value.

Definition at line 857 of file `random.h`.

4.672.3 Constructor & Destructor Documentation

4.672.3.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<`
`_RandomNumberEngine, __p, __r>::discard_block_engine () [inline]`

Constructs a default `discard_block_engine` engine.

The underlying engine is default constructed as well.

Definition at line 872 of file `random.h`.

4.672.3.2 `template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<`
`_RandomNumberEngine, __p, __r>::discard_block_engine (const _RandomNumberEngine & __rng)`
`[inline], [explicit]`

Copy constructs a `discard_block_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 882 of file random.h.

```
4.672.3.3  template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<
            _RandomNumberEngine, __p, __r>::discard_block_engine ( _RandomNumberEngine && __rng ) [inline],
            [explicit]
```

Move constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 892 of file random.h.

```
4.672.3.4  template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<
            _RandomNumberEngine, __p, __r>::discard_block_engine ( result_type __s ) [inline], [explicit]
```

Seed constructs a discard_block_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 902 of file random.h.

```
4.672.3.5  template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq, typename
            = typename std::enable_if<!std::is_same<_Sseq, discard_block_engine>::value && !std::is_same<_Sseq,
            _RandomNumberEngine>::value> ::type> std::discard_block_engine< _RandomNumberEngine, __p, __r
            >::discard_block_engine ( _Sseq & __q ) [inline], [explicit]
```

Generator construct a discard_block_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 915 of file random.h.

4.672.4 Member Function Documentation

```
4.672.4.1  template<typename _RandomNumberEngine, size_t __p, size_t __r> const _RandomNumberEngine&
            std::discard_block_engine< _RandomNumberEngine, __p, __r >::base ( ) const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

Definition at line 959 of file random.h.

```
4.672.4.2  template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<
            _RandomNumberEngine, __p, __r>::discard ( unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

Definition at line 980 of file random.h.

4.672.4.3 `template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type
std::discard_block_engine<_RandomNumberEngine, __p, __r>::max() [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 973 of file random.h.

References std::max().

4.672.4.4 `template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type
std::discard_block_engine<_RandomNumberEngine, __p, __r>::min() [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 966 of file random.h.

References std::min().

4.672.4.5 `template<typename _RandomNumberEngine, size_t __p, size_t __r> discard_block_engine<
_RandomNumberEngine, __p, __r>::result_type std::discard_block_engine<_RandomNumberEngine, __p, __r
>::operator()()`

Gets the next value in the generated random number sequence.

Definition at line 688 of file bits/random.tcc.

4.672.4.6 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<
_RandomNumberEngine, __p, __r>::seed() [inline]`

Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

Definition at line 924 of file random.h.

4.672.4.7 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<
_RandomNumberEngine, __p, __r>::seed(result_type __s) [inline]`

Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

Definition at line 935 of file random.h.

4.672.4.8 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq > void
std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed(_Sseq & __q) [inline]`

Reseeds the discard_block_engine object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 948 of file random.h.

4.672.5 Friends And Related Function Documentation

4.672.5.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1,
size_t __p1, size_t __r1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<<
(std::basic_ostream<_CharT, _Traits> & __os, const std::discard_block_engine<_RandomNumberEngine1,
__p1, __r1> & __x) [friend]`

Inserts the current state of a discard_block_engine random number generator engine __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>discard_block_engine</code> random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

```
4.672.5.2  template<typename _RandomNumberEngine, size_t __p, size_t __r> bool operator== ( const
discard_block_engine< _RandomNumberEngine, __p, __r > &__lhs, const discard_block_engine<
_RandomNumberEngine, __p, __r > &__rhs ) [friend]
```

Compares two `discard_block_engine` random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A <code>discard_block_engine</code> random number generator object.
<code>__rhs</code>	Another <code>discard_block_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1004 of file `random.h`.

```
4.672.5.3  template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1 ,
size_t __p1, size_t __r1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (
std::basic_istream<_CharT, _Traits > &__is, std::discard_block_engine<_RandomNumberEngine1, __p1,
__r1 > &__x ) [friend]
```

Extracts the current state of a `% subtract_with_carry_engine` random number generator engine `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>discard_block_engine</code> random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

4.673.1 Detailed Description

```
template<typename _IntType = int> class std::discrete_distribution< _IntType >
```

A discrete_distribution random number distribution.

The formula for the discrete probability mass function is

Definition at line 5251 of file random.h.

4.673.2 Member Typedef Documentation

4.673.2.1 `template<typename _IntType = int> typedef _IntType std::discrete_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 5254 of file random.h.

4.673.3 Member Function Documentation

4.673.3.1 `template<typename _IntType = int> result_type std::discrete_distribution< _IntType >::max () const`
[inline]

Returns the least upper bound value of the distribution.

Definition at line 5371 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`, and `std::vector< _Tp, _Alloc >::size()`.

4.673.3.2 `template<typename _IntType = int> result_type std::discrete_distribution< _IntType >::min () const`
[inline]

Returns the greatest lower bound value of the distribution.

Definition at line 5364 of file random.h.

4.673.3.3 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type`
`std::discrete_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng)` [inline]

Generating functions.

Definition at line 5382 of file random.h.

4.673.3.4 `template<typename _IntType = int> param_type std::discrete_distribution< _IntType >::param () const`
[inline]

Returns the parameter set of the distribution.

Definition at line 5349 of file random.h.

4.673.3.5 `template<typename _IntType = int> void std::discrete_distribution< _IntType >::param (const param_type &`
`__param)` [inline]

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5357 of file random.h.

4.673.3.6 `template<typename _IntType = int> std::vector<double> std::discrete_distribution< _IntType >::probabilities () const [inline]`

Returns the probabilities of the distribution.

Definition at line 5339 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`.

4.673.3.7 `template<typename _IntType = int> void std::discrete_distribution< _IntType >::reset () [inline]`

Resets the distribution state.

Definition at line 5332 of file random.h.

4.673.4 Friends And Related Function Documentation

4.673.4.1 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::discrete_distribution< _IntType1 > & __x) [friend]`

Inserts a `discrete_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>discrete_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.673.4.2 `template<typename _IntType = int> bool operator== (const discrete_distribution< _IntType > & __d1, const discrete_distribution< _IntType > & __d2) [friend]`

Return true if two discrete distributions have the same parameters.

Definition at line 5417 of file random.h.

4.673.4.3 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > std::basic_istream< _CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is, std::discrete_distribution< _IntType1 > & __x) [friend]`

Extracts a `discrete_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
-------------------	------------------

__x	A discrete_distribution random number generator engine.
-----	---

Returns

The input stream with __x extracted or in an error state.

4.683.1 Detailed Description

```
template<typename _RealType = double> class std::exponential_distribution<_RealType>
```

An exponential continuous distribution for random numbers.

The formula for the exponential probability density function is $p(x|\lambda) = \lambda e^{-\lambda x}$.

Mean	$\frac{1}{\lambda}$
Median	$\frac{\ln 2}{\lambda}$
Mode	<i>zero</i>
Range	$[0, \infty]$
Standard Deviation	$\frac{1}{\lambda}$

Table 2: Distribution Statistics

Definition at line 4646 of file random.h.

4.683.2 Member Typedef Documentation

4.683.2.1 `template<typename _RealType = double> typedef _RealType std::exponential_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 4649 of file random.h.

4.683.3 Member Function Documentation

4.683.3.1 `template<typename _RealType = double> result_type std::exponential_distribution<_RealType>::max ()`
`const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4734 of file random.h.

References std::numeric_limits<_Tp>::max().

4.683.3.2 `template<typename _RealType = double> result_type std::exponential_distribution<_RealType>::min ()`
`const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4727 of file random.h.

4.683.3.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type`
`std::exponential_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng)`

4.685.1 Detailed Description

```
template<typename _RealType = double> class std::extreme_value_distribution< _RealType >
```

A `extreme_value_distribution` random number distribution.

The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b} \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right)$$

Definition at line 5051 of file random.h.

4.685.2 Member Typedef Documentation

```
4.685.2.1 template<typename _RealType = double> typedef _RealType std::extreme_value_distribution< _RealType
>::result_type
```

The type of the range of the distribution.

Definition at line 5054 of file random.h.

4.685.3 Member Function Documentation

```
4.685.3.1 template<typename _RealType = double> _RealType std::extreme_value_distribution< _RealType >::a ( ) const
[inline]
```

Return the a parameter of the distribution.

Definition at line 5109 of file random.h.

```
4.685.3.2 template<typename _RealType = double> _RealType std::extreme_value_distribution< _RealType >::b ( ) const
[inline]
```

Return the b parameter of the distribution.

Definition at line 5116 of file random.h.

```
4.685.3.3 template<typename _RealType = double> result_type std::extreme_value_distribution< _RealType >::max ( )
const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 5145 of file random.h.

References `std::numeric_limits<_Tp>::max()`.

```
4.685.3.4 template<typename _RealType = double> result_type std::extreme_value_distribution< _RealType >::min ( )
const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 5138 of file random.h.

References std::numeric_limits<_Tp>::lowest().

4.685.3.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type
std::extreme_value_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng)
[inline]`

Generating functions.

Definition at line 5153 of file random.h.

4.685.3.6 `template<typename _RealType = double> param_type std::extreme_value_distribution<_RealType>::param (
) const [inline]`

Returns the parameter set of the distribution.

Definition at line 5123 of file random.h.

Referenced by std::operator>>().

4.685.3.7 `template<typename _RealType = double> void std::extreme_value_distribution<_RealType>::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5131 of file random.h.

4.685.3.8 `template<typename _RealType = double> void std::extreme_value_distribution<_RealType>::reset ()
[inline]`

Resets the distribution state.

Definition at line 5102 of file random.h.

4.687.4 Friends And Related Function Documentation

4.687.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits>`
`std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> &__os, const`
`std::fisher_f_distribution<_RealType1> &__x) [friend]`

Inserts a `fisher_f_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>fisher_f_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.687.4.2 `template<typename _RealType = double> bool operator==(const fisher_f_distribution<_RealType> &__d1, const fisher_f_distribution<_RealType> &__d2) [friend]`

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3280 of file random.h.

4.687.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> &__is, std::fisher_f_distribution<_RealType1> &__x) [friend]`

Extracts a fisher_f_distribution random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A fisher_f_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.690.1 Detailed Description

template<typename _Tp, typename _Alloc = allocator<_Tp>> class std::forward_list< _Tp, _Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access

iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

Definition at line 414 of file `forward_list.h`.

4.690.2 Constructor & Destructor Documentation

4.690.2.1 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (size_type __n, const _Tp & __value, const _Alloc & __al = _Alloc()) [inline]`

Creates a `forward_list` with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__al</code>	An allocator object.

This constructor fills the `forward_list` with `__n` copies of `__value`.

Definition at line 490 of file `forward_list.h`.

4.690.2.2 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> std::forward_list<_Tp, _Alloc>::forward_list (_InputIterator __first, _InputIterator __last, const _Alloc & __al = _Alloc()) [inline]`

Builds a `forward_list` from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__al</code>	An allocator object.

Create a `forward_list` consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is distance(`-__first, __last`)).

Definition at line 507 of file `forward_list.h`.

4.690.2.3 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (const forward_list<_Tp, _Alloc> & __list) [inline]`

The `forward_list` copy constructor.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

Definition at line 517 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::begin()`.

4.690.2.4 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (forward_list<_Tp, _Alloc> && __list) [inline], [noexcept]`

The `forward_list` move constructor.

Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	--

The newly-created forward_list contains the exact contents of `__list`. The contents of `__list` are a valid, but unspecified forward_list.

Definition at line 531 of file forward_list.h.

4.690.2.5 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (std::initializer_list<_Tp> & __il, const _Alloc & __al = _Alloc()) [inline]`

Builds a forward_list from an initializer_list.

Parameters

<code>__il</code>	An initializer_list of value_type.
<code>__al</code>	An allocator object.

Create a forward_list consisting of copies of the elements in the initializer_list `__il`. This is linear in `__il.size()`.

Definition at line 542 of file forward_list.h.

4.690.2.6 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::~~forward_list () [inline], [noexcept]`

The forward_list dtor.

Definition at line 550 of file forward_list.h.

4.690.3 Member Function Documentation

4.690.3.1 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>>> void std::forward_list<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a forward_list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a forward_list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the forward_list and that the number of elements of the resulting forward_list is the same as the number of elements assigned. Old data is lost.

Definition at line 615 of file forward_list.h.

Referenced by `std::forward_list<_Tp, _Alloc>::assign()`, and `std::forward_list<_Tp, _Alloc>::operator=()`.

4.690.3.2 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::assign (size_type __n, const _Tp & __val) [inline]`

Assigns a given value to a forward_list.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a `forward_list` with `__n` copies of the given value. Note that the assignment completely changes the `forward_list`, and that the resulting `forward_list` has `__n` elements. Old data is lost.

Definition at line 632 of file `forward_list.h`.

4.690.3.3 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::assign (std::initializer_list<_Tp> __il) [inline]`

Assigns an `initializer_list` to a `forward_list`.

Parameters

<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .
-------------------	---

Replace the contents of the `forward_list` with copies of the elements in the `initializer_list` `__il`. This is linear in `il.size()`.

Definition at line 644 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::assign()`.

4.690.3.4 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::before_begin () [inline], [noexcept]`

Returns a read/write iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 659 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::insert_after()`.

4.690.3.5 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::before_begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 668 of file `forward_list.h`.

4.690.3.6 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 676 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::forward_list()`.

4.690.3.7 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 685 of file `forward_list.h`.

4.690.3.8 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::cbefore_begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 721 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::emplace_front(), and std::forward_list< _Tp, _Alloc >::push_front().

4.690.3.9 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Definition at line 712 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::operator=(), and std::operator==().

4.690.3.10 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Definition at line 730 of file forward_list.h.

Referenced by std::forward_list< _Tp, _Alloc >::operator=(), and std::operator==().

4.690.3.11 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::clear () [inline], [noexcept]`

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1033 of file forward_list.h.

4.690.3.12 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> iterator std::forward_list< _Tp, _Alloc >::emplace_after (const_iterator __pos, _Args &&... __args) [inline]`

Constructs object in forward_list after the specified iterator.

Parameters

<code>__pos</code>	A const_iterator into the forward_list.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...)` after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 843 of file `forward_list.h`.

```
4.690.3.13  template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> void  
            std::forward_list<_Tp, _Alloc>::emplace_front ( _Args &&... __args )  [inline]
```

Constructs object in `forward_list` at the front of the list.

Parameters

<code>__args</code>	Arguments.
---------------------	------------

This function will insert an object of type `Tp` constructed with `Tp(std::forward<Args>(args)...) at the front of the list`. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 787 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc >::cbefore_begin()`.

4.690.3.14 `template<typename _Tp, typename _Alloc = allocator<_Tp>> bool std::forward_list<_Tp, _Alloc >::empty ()`
`const [inline], [noexcept]`

Returns true if the `forward_list` is empty. (Thus `begin()` would equal `end()`.)

Definition at line 738 of file `forward_list.h`.

4.690.3.15 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc >::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 694 of file `forward_list.h`.

4.690.3.16 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc`
`>::end () const [inline], [noexcept]`

Returns a read-only iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 703 of file `forward_list.h`.

4.690.3.17 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc`
`>::erase_after (const_iterator __pos) [inline]`

Removes the element pointed to by the iterator following `pos`.

Parameters

<code>__pos</code>	Iterator pointing before element to be erased.
--------------------	--

Returns

An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

This function will erase the element at the given position and thus shorten the `forward_list` by one.

Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 946 of file `forward_list.h`.

4.690.3.18 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc`
`>::erase_after (const_iterator __pos, const_iterator __last) [inline]`

Remove a range of elements.

Parameters

<code>__pos</code>	Iterator pointing before the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

@ `__last`.

This function will erase the elements in the range (`__pos`,`__last`) and shorten the `forward_list` accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 969 of file `forward_list.h`.

4.690.3.19 `template<typename _Tp, typename _Alloc = allocator<_Tp>> reference std::forward_list<_Tp, _Alloc>::front ()`
`[inline]`

Returns a read/write reference to the data at the first element of the `forward_list`.

Definition at line 755 of file `forward_list.h`.

4.690.3.20 `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_reference std::forward_list<_Tp, _Alloc>::front () const` `[inline]`

Returns a read-only (constant) reference to the data at the first element of the `forward_list`.

Definition at line 766 of file `forward_list.h`.

4.690.3.21 `template<typename _Tp, typename _Alloc = allocator<_Tp>> allocator_type std::forward_list<_Tp, _Alloc>::get_allocator () const` `[inline]`, `[noexcept]`

Get a copy of the memory allocation object.

Definition at line 649 of file `forward_list.h`.

4.690.3.22 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::insert_after (const_iterator __pos, const _Tp &__val)` `[inline]`

Inserts given value into `forward_list` after specified iterator.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__val</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 860 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::insert_after()`.

```
4.690.3.23  template<typename _Tp, typename _Alloc > forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (
               const_iterator __pos, size_type __n, const _Tp & __val )
```

Inserts a number of copies of given data into the forward_list.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__n</code>	Number of elements to be inserted.
<code>__val</code>	Data to be inserted.

Returns

An iterator pointing to the last inserted copy of `val` or `pos` if `n == 0`.

This function will insert a specified number of copies of the given data after the location specified by `pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 272 of file `forward_list.tcc`.

References `std::forward_list<_Tp, _Alloc>::before_begin()`.

4.690.3.24 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> iterator std::forward_list<_Tp, _Alloc>::insert_after (const_iterator __pos, _InputIterator __first, _InputIterator __last)`

Inserts a range into the `forward_list`.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range `[__first, __last)` into the `forward_list` after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

4.690.3.25 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::insert_after (const_iterator __pos, std::initializer_list<_Tp> __il) [inline]`

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__il</code>	An <code>initializer_list</code> of value_type.

Returns

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the `initializer_list` `__il` into the `forward_list` before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 925 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::insert_after()`.

4.690.3.26 `template<typename _Tp, typename _Alloc = allocator<_Tp>> size_type std::forward_list< _Tp, _Alloc >::max_size () const [inline], [noexcept]`

Returns the largest possible number of elements of forward_list.

Definition at line 745 of file forward_list.h.

References `std::allocator_traits< _Alloc >::max_size()`.

4.690.3.27 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::merge (forward_list< _Tp, _Alloc > && __list) [inline]`

Merge sorted lists.

Parameters

<code>__list</code>	Sorted list to merge.
---------------------	-----------------------

Assumes that both `__list` and this list are sorted according to `operator<()`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

Definition at line 1171 of file forward_list.h.

4.690.3.28 `template<typename _Tp, typename _Alloc > template<typename _Comp > void forward_list::merge (forward_list< _Tp, _Alloc > && __list, _Comp __comp)`

Merge sorted lists according to comparison function.

Parameters

<code>__list</code>	Sorted list to merge.
<code>__comp</code>	Comparison function defining sort order.

Assumes that both `__list` and this list are sorted according to `comp`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to `comp()`.

Definition at line 365 of file forward_list.tcc.

4.690.3.29 `template<typename _Tp, typename _Alloc > forward_list< _Tp, _Alloc > & forward_list::operator= (const forward_list< _Tp, _Alloc > & __list)`

The forward_list assignment operator.

Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	--

All the elements of `__list` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 156 of file forward_list.tcc.

References `std::forward_list< _Tp, _Alloc >::cbegin()`, and `std::forward_list< _Tp, _Alloc >::cend()`.

4.690.3.30 `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list< _Tp, _Alloc >::operator= (forward_list< _Tp, _Alloc > && __list) [inline]`

The forward_list move assignment operator.

Parameters

<code>__list</code>	A forward_list of identical element and allocator types.
---------------------	--

The contents of `__list` are moved into this forward_list (without copying, if the allocators permit it). `__list` is a valid, but unspecified forward_list

Definition at line 574 of file forward_list.h.

```
4.690.3.31  template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list<_Tp, _Alloc>::operator=( std::initializer_list<_Tp> &__il )  [inline]
```

The forward_list initializer list assignment operator.

Parameters

<code>__il</code>	An initializer_list of value_type.
-------------------	------------------------------------

Replace the contents of the forward_list with copies of the elements in the initializer_list `__il`. This is linear in `__il.size()`.

Definition at line 594 of file forward_list.h.

References `std::forward_list<_Tp, _Alloc>::assign()`.

```
4.690.3.32  template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::pop_front ( )  [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the forward_list by one. Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 825 of file forward_list.h.

```
4.690.3.33  template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::push_front ( const _Tp &__val )  [inline]
```

Add data to the front of the forward_list.

Parameters

<code>__val</code>	Data to be added.
--------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the forward_list and assigns the given data to it. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 802 of file forward_list.h.

References `std::forward_list<_Tp, _Alloc>::cbefore_begin()`.

```
4.690.3.34  template<typename _Tp, typename _Alloc> void forward_list::remove ( const _Tp &__val )
```

Remove all elements equal to value.

Parameters

<code>__val</code>	The value to remove.
--------------------	----------------------

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 300 of file forward_list.tcc.

References `std::__addressof()`.

4.690.3.35 `template<typename _Tp, typename _Alloc > template<typename _Pred > void forward_list::remove_if (_Pred __pred)`

Remove all elements satisfying a predicate.

Parameters

<code>__pred</code>	Unary predicate function or object.
---------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 328 of file `forward_list.tcc`.

4.690.3.36 `template<typename _Tp, typename _Alloc > void forward_list::resize (size_type __sz)`

Resizes the `forward_list` to the specified number of elements.

Parameters

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
-------------------	--

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and the new elements are default constructed.

Definition at line 198 of file `forward_list.tcc`.

References `std::end()`.

4.690.3.37 `template<typename _Tp, typename _Alloc > void forward_list::resize (size_type __sz, const value_type & __val)`

Resizes the `forward_list` to the specified number of elements.

Parameters

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
<code>__val</code>	Data with which new elements should be populated.

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and new elements are populated with given data.

Definition at line 217 of file `forward_list.tcc`.

References `std::end()`.

4.690.3.38 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::reverse ()
[inline], [noexcept]`

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1224 of file `forward_list.h`.

4.690.3.39 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::sort ()
[inline]`

Sort the elements of the list.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 1205 of file `forward_list.h`.

4.690.3.40 `template<typename _Tp, class _Alloc> template<typename _Comp> void forward_list::sort (_Comp __comp)`

Sort the `forward_list` using a comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 411 of file `forward_list.tcc`.

4.690.3.41 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::splice_after (const_iterator __pos, forward_list<_Tp, _Alloc> && __list) [inline]`

Insert contents of another `forward_list`.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.

The elements of `list` are inserted in constant time after the element referenced by `pos`. `list` becomes an empty list.

Requires this != x.

Definition at line 1050 of file `forward_list.h`.

4.690.3.42 `template<typename _Tp, typename _Alloc> void forward_list::splice_after (const_iterator __pos, forward_list<_Tp, _Alloc> && __list, const_iterator __i)`

Insert element from another `forward_list`.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__i</code>	Iterator referencing the element before the element to move.

Removes the element in list `list` referenced by `i` and inserts it into the current list after `pos`.

Definition at line 255 of file `forward_list.tcc`.

4.690.3.43 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::splice_after (const_iterator __pos, forward_list<_Tp, _Alloc> &&, const_iterator __before, const_iterator __last) [inline]`

Insert range from another `forward_list`.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in list.
<code>__last</code>	Iterator referencing the end of range in list.

Removes elements in the range (`__before`,`__last`) and inserts them after `__pos` in constant time.

Undefined if `__pos` is in (`__before`,`__last`).

Definition at line 1093 of file `forward_list.h`.

4.690.3.44 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::std::swap (this->_M_impl._M_head._M_next, __list._M_impl._M_head._M_next)`

Swaps data with another `forward_list`.

Parameters

<code>__list</code>	A forward_list of the same element and allocator types.
---------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

4.690.3.45 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::unique ()`
`[inline]`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1142 of file `forward_list.h`.

4.690.3.46 `template<typename _Tp, typename _Alloc > template<typename _BinPred > void forward_list::unique (_BinPred`
`__binary_pred)`

Remove consecutive elements satisfying a predicate.

Parameters

<code>__binary_pred</code>	Binary predicate function or object.
----------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 344 of file `forward_list.tcc`.

References `std::begin()`, and `std::end()`.

4.690.4 Member Data Documentation

4.690.4.1 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::__pad0__`
`[explicit]`

Creates a forward_list with no elements.

Parameters

<code>__a/</code>	An allocator object.
-------------------	----------------------

Definition at line 455 of file `forward_list.h`.

4.690.4.2 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::__pad1__`

Move constructor with allocator argument.

Parameters

<code>__list</code>	Input list to move.
<code>__a/</code>	An allocator object.

Definition at line 466 of file `forward_list.h`.

4.690.4.3 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::__pad2__
[explicit]`

Creates a `forward_list` with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor creates the `forward_list` with `__n` default constructed elements.

Definition at line 479 of file `forward_list.h`.

- `_StateT` [state](#) () const

4.691.1 Detailed Description

```
template<typename _StateT>class std::fpos<_StateT>
```

Class representing stream positions.

The standard places no requirements upon the template parameter `StateT`. In this implementation `StateT` must be `DefaultConstructible`, `CopyConstructible` and `Assignable`. The standard only requires that `fpos` should contain a member of type `StateT`. In this implementation it also contains an offset stored as a signed integer.

Parameters

<i>StateT</i>	Type passed to and returned from <code>state()</code> .
---------------	---

Definition at line 112 of file `postypes.h`.

4.691.2 Constructor & Destructor Documentation

4.691.2.1 `template<typename _StateT> std::fpos<_StateT>::fpos (streamoff __off) [inline]`

Construct position from offset.

Definition at line 133 of file `postypes.h`.

4.691.3 Member Function Documentation

4.691.3.1 `template<typename _StateT> std::fpos<_StateT>::operator streamoff () const [inline]`

Convert to streamoff.

Definition at line 137 of file postypes.h.

4.691.3.2 `template<typename _StateT> fpos std::fpos<_StateT>::operator+ (streamoff __off) const [inline]`

Add position and offset.

Definition at line 178 of file postypes.h.

4.691.3.3 `template<typename _StateT> fpos& std::fpos<_StateT>::operator+= (streamoff __off) [inline]`

Add offset to this position.

Definition at line 154 of file postypes.h.

4.691.3.4 `template<typename _StateT> fpos std::fpos<_StateT>::operator- (streamoff __off) const [inline]`

Subtract offset from position.

Definition at line 192 of file postypes.h.

4.691.3.5 `template<typename _StateT> streamoff std::fpos<_StateT>::operator- (const fpos<_StateT> & __other) const [inline]`

Subtract position to return offset.

Definition at line 205 of file postypes.h.

4.691.3.6 `template<typename _StateT> fpos& std::fpos<_StateT>::operator-= (streamoff __off) [inline]`

Subtract offset from this position.

Definition at line 165 of file postypes.h.

4.691.3.7 `template<typename _StateT> void std::fpos<_StateT>::state (_StateT __st) [inline]`

Remember the value of *st*.

Definition at line 141 of file postypes.h.

4.691.3.8 `template<typename _StateT> _StateT std::fpos<_StateT>::state () const [inline]`

Return the last set value of *st*.

Definition at line 146 of file postypes.h.

- `front_insert_iterator` & `operator=` (typename `_Container::value_type` &&__value)

Protected Attributes

- `_Container *` **`container`**

4.692.1 Detailed Description

```
template<typename _Container>class std::front_insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using `push_front`.

Tip: Using the `front_inserter` function to create these iterators can save typing.

Definition at line 494 of file `stl_iterator.h`.

4.692.2 Member Typedef Documentation

4.692.2.1 `template<typename _Container> typedef _Container std::front_insert_iterator<_Container>::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 502 of file `stl_iterator.h`.

4.692.2.2 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::difference_type` [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.692.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void>::iterator_category` [inherited]

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.692.2.4 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::pointer` [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.692.2.5 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::reference` [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.692.2.6 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::value_type` [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.692.3 Constructor & Destructor Documentation

4.692.3.1 `template<typename _Container> std::front_insert_iterator<_Container>::front_insert_iterator (_Container &__x)` [inline],[explicit]

The only way to create this iterator is with a container.

Definition at line 505 of file `stl_iterator.h`.

4.692.4 Member Function Documentation

4.692.4.1 `template<typename _Container> front_insert_iterator& std::front_insert_iterator<_Container>::operator* ()` [inline]

Simply returns `*this`.

Definition at line 543 of file `stl_iterator.h`.

4.692.4.2 `template<typename _Container> front_insert_iterator& std::front_insert_iterator<_Container>::operator++ () [inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 548 of file `stl_iterator.h`.

4.692.4.3 `template<typename _Container> front_insert_iterator std::front_insert_iterator<_Container>::operator++ (int) [inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 553 of file `stl_iterator.h`.

4.692.4.4 `template<typename _Container> front_insert_iterator& std::front_insert_iterator<_Container>::operator= (const typename _Container::value_type & __value) [inline]`

Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const <code>T</code> for <code>container<T></code> .
----------------------	--

Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

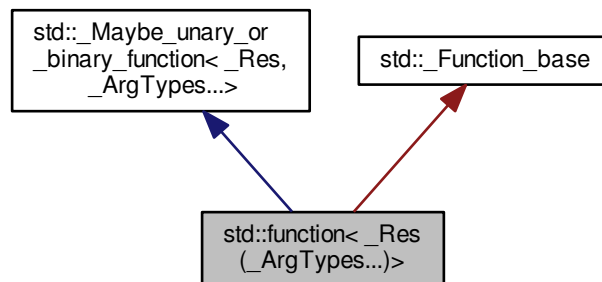

Definition at line 527 of file `stl_iterator.h`.

4.693.1 Detailed Description

```
template<typename _Res, typename... _ArgTypes>class std::function< _Res(_ArgTypes...)>
```

Primary class template for std::function.

Polymorphic function wrapper.

Definition at line 2142 of file functional.

4.693.2 Constructor & Destructor Documentation

```
4.693.2.1 template<typename _Res, typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function ( ) [inline],
[noexcept]
```

Default construct creates an empty function call wrapper.

Postcondition

```
!(bool)*this
```

Definition at line 2167 of file functional.

```
4.693.2.2 template<typename _Res, typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function ( nullptr_t )
[inline], [noexcept]
```

Creates an empty function call wrapper.

Postcondition

```
!(bool)*this
```

Definition at line 2174 of file functional.

```
4.693.2.3 template<typename _Res, typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function ( const function<
_Res(_ArgTypes...)> & __x )
```

Function copy constructor.

Parameters

__x	A function object with identical call signature.
-----	--

Postcondition

```
bool(*this) == bool(__x)
```

The newly-created function contains a copy of the target of __x (if it has one).

Definition at line 2398 of file functional.

```
4.693.2.4 template<typename _Res, typename... _ArgTypes> std::function< _Res(_ArgTypes...)>::function ( function<
_Res(_ArgTypes...)> && __x ) [inline]
```

Function move constructor.

Parameters

<code>__x</code>	A function object rvalue with identical call signature.
------------------	---

The newly-created function contains the target of `__x` (if it has one).

Definition at line 2194 of file functional.

4.693.2.5 `template<typename _Res, typename... _ArgTypes> template<typename _Functor, typename > std::function<_Res(_ArgTypes...)>::function (_Functor __f)`

Builds a function that targets a copy of the incoming function object.

Parameters

<code>__f</code>	A function object that is callable with parameters of type T1, T2, ..., TN and returns a value convertible to Res.
------------------	--

The newly-created function object will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a NULL function pointer or NULL pointer-to-member, the newly-created object will be empty.

If `__f` is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

Definition at line 2412 of file functional.

4.693.3 Member Function Documentation

4.693.3.1 `template<typename _Res, typename... _ArgTypes> std::function<_Res(_ArgTypes...)>::operator bool () const [inline], [explicit], [noexcept]`

Determine if the function wrapper has a target.

Returns

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw an exception.

Definition at line 2347 of file functional.

4.693.3.2 `template<typename _Res, typename... _ArgTypes> _Res std::function<_Res(_ArgTypes...)>::operator() (_ArgTypes... __args) const`

Invokes the function targeted by `*this`.

Returns

the result of the target.

Exceptions

<code>bad_function_call</code>	when <code>!(bool)*this</code>
--------------------------------	--------------------------------

The function call operator invokes the target function object stored by `this`.

Definition at line 2428 of file functional.

4.693.3.3 `template<typename _Res, typename... _ArgTypes> function& std::function<_Res(_ArgTypes...)>::operator= (const function<_Res(_ArgTypes...)> & __x) [inline]`

Function assignment operator.

Parameters

<code>__x</code>	A function with identical call signature.
------------------	---

Postcondition

```
(bool)*this == (bool)x
```

Returns

```
*this
```

The target of `__x` is copied to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

Definition at line 2234 of file functional.

References `std::swap()`.

```
4.693.3.4 template<typename _Res, typename... _ArgTypes> function& std::function< _Res(_ArgTypes...)>::operator= (
    function< _Res(_ArgTypes...)> && __x ) [inline]
```

Function move-assignment operator.

Parameters

<code>__x</code>	A function rvalue with identical call signature.
------------------	--

Returns

```
*this
```

The target of `__x` is moved to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

Definition at line 2252 of file functional.

References `std::swap()`.

```
4.693.3.5 template<typename _Res, typename... _ArgTypes> function& std::function< _Res(_ArgTypes...)>::operator= (
    nullptr_t ) [inline]
```

Function assignment to zero.

Postcondition

```
!(bool)*this
```

Returns

```
*this
```

The target of `*this` is deallocated, leaving it empty.

Definition at line 2266 of file functional.

```
4.693.3.6 template<typename _Res, typename... _ArgTypes> template<typename _Functor > _Requires<_Callable<_Functor>,
    function&> std::function< _Res(_ArgTypes...)>::operator= ( _Functor && __f ) [inline]
```

Function assignment to a new target.

Parameters

<code>__f</code>	A function object that is callable with parameters of type T1, T2, ..., TN and returns a value convertible to Res.
------------------	--

Returns

`*this`

This function object wrapper will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a NULL function pointer or NULL pointer-to-member, `this` object will be empty.

If `__f` is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

Definition at line 2295 of file functional.

```
4.693.3.7 template<typename _Res, typename... _ArgTypes> template<typename _Functor> function& std::function<
    _Res(_ArgTypes...)>::operator=( reference_wrapper<_Functor> __f ) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 2304 of file functional.

References `std::swap()`.

```
4.693.3.8 template<typename _Res, typename... _ArgTypes> void std::function< _Res(_ArgTypes...)>::swap ( function<
    _Res(_ArgTypes...) & __x ) [inline]
```

Swap the targets of two function objects.

Parameters

<code>__x</code>	A function with identical call signature.
------------------	---

Swap the targets of `this` function object and `__f`. This function will not throw an exception.

Definition at line 2319 of file functional.

References `std::swap()`.

```
4.693.3.9 template<typename _Res, typename... _ArgTypes> template<typename _Functor> _Functor * std::function<
    _Res(_ArgTypes...)>::target ( ) [noexcept]
```

Access the stored target function object.

Returns

Returns a pointer to the stored target function object, if `typeid(Functor).equals(target_type())`; otherwise, a NULL pointer.

This function will not throw an exception.

Definition at line 2455 of file functional.

```
4.693.3.10 template<typename _Res, typename... _ArgTypes> template<typename _Functor> const _Functor * std::function<
    _Res(_ArgTypes...)>::target ( ) const [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Definition at line 2474 of file functional.

4.693.3.11 `template<typename _Res, typename... _ArgTypes> const type_info & std::function<_Res(_ArgTypes...)>::target_type () const [noexcept]`

Determine the type of the target of this function object wrapper.

Returns

the type identifier of the target function object, or `typeid(void)` if `!(bool)*this`.

This function will not throw an exception.

Definition at line 2439 of file `functional`.

- [functional](#)

4.694 `std::future_error` Class Reference

Inheritance diagram for `std::future_error`:

Public Member Functions

- `future_error (error_code __ec)`
- `const error_code & code () const noexcept`
- `virtual const char * what () const noexcept`

4.694.1 Detailed Description

Exception type thrown by futures.

Definition at line 94 of file `future`.

4.694.2 Member Function Documentation

4.694.2.1 `virtual const char* std::future_error::what() const` `[virtual]`, `[noexcept]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from `std::logic_error`.

The documentation for this class was generated from the following file:

- [future](#)

4.695.1 Detailed Description

```
template<typename _RealType = double>class std::gamma_distribution<_RealType>
```

A gamma continuous distribution for random numbers.

The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta \Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

Definition at line 2502 of file random.h.

4.695.2 Member Typedef Documentation

4.695.2.1 template<typename _RealType = double> typedef _RealType std::gamma_distribution<_RealType>::result_type

The type of the range of the distribution.

Definition at line 2505 of file random.h.

4.695.3 Constructor & Destructor Documentation

4.695.3.1 template<typename _RealType = double> std::gamma_distribution<_RealType>::gamma_distribution (_RealType __alpha_val = _RealType(1), _RealType __beta_val = _RealType(1)) [inline], [explicit]

Constructs a gamma distribution with parameters α and β .

Definition at line 2554 of file random.h.

4.695.4 Member Function Documentation

4.695.4.1 template<typename _RealType = double> _RealType std::gamma_distribution<_RealType>::alpha () const [inline]

Returns the α of the distribution.

Definition at line 2575 of file random.h.

4.695.4.2 `template<typename _RealType = double> _RealType std::gamma_distribution< _RealType >::beta () const`
`[inline]`

Returns the β of the distribution.

Definition at line 2582 of file random.h.

4.695.4.3 `template<typename _RealType = double> result_type std::gamma_distribution< _RealType >::max () const`
`[inline]`

Returns the least upper bound value of the distribution.

Definition at line 2611 of file random.h.

4.695.4.4 `template<typename _RealType = double> result_type std::gamma_distribution< _RealType >::min () const`
`[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2604 of file random.h.

4.695.4.5 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator >`
`gamma_distribution< _RealType >::result_type std::gamma_distribution< _RealType >::operator() (`
`_UniformRandomNumberGenerator & __urng, const param_type & __param)`

Marsaglia, G. and Tsang, W. W. "A Simple Method for Generating Gamma Variables" ACM Transactions on Mathematical Software, 26, 3, 363-372, 2000.

Definition at line 2489 of file bits/random.tcc.

References `std::log()`, and `std::pow()`.

4.695.4.6 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator > result_type`
`std::gamma_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 2619 of file random.h.

Referenced by `std::gamma_distribution< result_type >::operator()()`.

4.695.4.7 `template<typename _RealType = double> param_type std::gamma_distribution< _RealType >::param () const`
`[inline]`

Returns the parameter set of the distribution.

Definition at line 2589 of file random.h.

4.695.4.8 `template<typename _RealType = double> void std::gamma_distribution< _RealType >::param (const`
`param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2597 of file random.h.

4.695.4.9 `template<typename _RealType = double> void std::gamma_distribution<_RealType>::reset () [inline]`

Resets the distribution state.

Definition at line 2568 of file random.h.

Referenced by `std::chi_squared_distribution<_RealType>::reset()`, `std::fisher_f_distribution<_RealType>::reset()`, `std::student_t_distribution<_RealType>::reset()`, and `std::negative_binomial_distribution<_IntType>::reset()`.

4.695.5 Friends And Related Function Documentation

4.695.5.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> &__os, const std::gamma_distribution<_RealType1> &__x) [friend]`

Inserts a gamma_distribution random number distribution __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A gamma_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.695.5.2 `template<typename _RealType = double> bool operator==(const gamma_distribution<_RealType> &__d1, const gamma_distribution<_RealType> &__d2) [friend]`

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2655 of file random.h.

4.695.5.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> &__is, std::gamma_distribution<_RealType1> &__x) [friend]`

Extracts a gamma_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A gamma_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

`class valarray`

4.701.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size.

For example, if you have `offset==3`, `stride[0]==11`, `size[1]==3`, `stride[1]==3`, then `slice[0,0]==array[3]`, `slice[0,1]==array[6]`, `slice[0,2]==array[9]`, `slice[1,0]==array[14]`, `slice[1,1]==array[17]`, `slice[1,2]==array[20]`.

4.702.1 Detailed Description

`template<class _Tp>class std::gslice_array< _Tp >`

Reference to multi-dimensional subset of an array.

A `gslice_array` is a reference to the actual elements of an array specified by a `gslice`. The way to get a `gslice_array` is to call `operator[](gslice)` on a `valarray`. The returned `gslice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `gslice_array` refers to.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 82 of file `valarray`.

4.745.1 Detailed Description

`template<typename _RandomNumberEngine, size_t __w, typename _UIntType>class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >`

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits __w.

Definition at line 1074 of file random.h.

4.745.2 Member Typedef Documentation

4.745.2.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> typedef _UIntType`
`std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type`

The type of the generated random value.

Definition at line 1077 of file random.h.

4.745.3 Constructor & Destructor Documentation

4.745.3.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine<`
`_RandomNumberEngine, __w, _UIntType >::independent_bits_engine () [inline]`

Constructs a default `independent_bits_engine` engine.

The underlying engine is default constructed as well.

Definition at line 1090 of file random.h.

4.745.3.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::independent_bits_engine (const _RandomNumberEngine & __rng) [inline], [explicit]`

Copy constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1100 of file `random.h`.

4.745.3.3 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::independent_bits_engine (_RandomNumberEngine && __rng) [inline], [explicit]`

Move constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1110 of file `random.h`.

4.745.3.4 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::independent_bits_engine (result_type __s) [inline], [explicit]`

Seed constructs a `independent_bits_engine` engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 1120 of file `random.h`.

4.745.3.5 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq, typename = typename std::enable_if<!std::is_same<_Sseq, independent_bits_engine>::value && !std::is_same<_Sseq, _RandomNumberEngine>::value> ::type> std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::independent_bits_engine (_Sseq & __q) [inline], [explicit]`

Generator construct a `independent_bits_engine` engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 1133 of file `random.h`.

4.745.4 Member Function Documentation

4.745.4.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> const _RandomNumberEngine& std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::base () const [inline], [noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 1168 of file random.h.

Referenced by `std::operator<<()`.

4.745.4.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (unsigned long long __z) [inline]`

Discard a sequence of random numbers.

Definition at line 1189 of file random.h.

4.745.4.3 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::max () [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 1182 of file random.h.

4.745.4.4 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::min () [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 1175 of file random.h.

4.745.4.5 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType > independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator() ()`

Gets the next value in the generated random number sequence.

Definition at line 745 of file bits/random.tcc.

References `std::__lg()`, `std::numeric_limits< _Tp >::max()`, and `std::numeric_limits< _Tp >::min()`.

4.745.4.6 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed () [inline]`

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1142 of file random.h.

4.745.4.7 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (result_type __s) [inline]`

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1150 of file random.h.

4.745.4.8 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq > void
std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType >::seed (_Sseq & __q) [inline]`

Reseeds the `independent_bits_engine` object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 1160 of file random.h.

4.745.5 Friends And Related Function Documentation

4.745.5.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> bool operator==(const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __lhs, const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __rhs) [friend]`

Compares two independent_bits_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A independent_bits_engine random number generator object.
<code>__rhs</code>	Another independent_bits_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1214 of file random.h.

4.745.5.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _CharT, typename _Traits > std::basic_istream< _CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & __is, std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x) [friend]`

Extracts the current state of a % subtract_with_carry_engine random number generator engine `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A independent_bits_engine random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

Definition at line 1232 of file random.h.

- class `valarray<_Tp>`

4.746.1 Detailed Description

template<class _Tp>class std::indirect_array<_Tp>

Reference to arbitrary subset of an array.

An `indirect_array` is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an `indirect_array` is to call `operator[]`(`valarray<size_t>`) on a `valarray`. The returned `indirect_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if an `indirect_array` is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have `array[0]==3`, `array[2]==2`, and `array[4]==1`.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 84 of file `valarray`.

The documentation for this class was generated from the following files:

- [valarray](#)
- [indirect_array.h](#)

Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

Public Member Functions

- `insert_iterator` (`_Container &__x`, `typename _Container::iterator __i`)
- `insert_iterator` & `operator*` ()
- `insert_iterator` & `operator++` ()
- `insert_iterator` & `operator++` (int)
- `insert_iterator` & `operator=` (const `typename _Container::value_type &__value`)
- `insert_iterator` & `operator=` (`typename _Container::value_type &&__value`)

Protected Attributes

- `_Container * container`
- `_Container::iterator iter`

4.749.1 Detailed Description

```
template<typename _Container>class std::insert_iterator<_Container>
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

Definition at line 588 of file `stl_iterator.h`.

4.749.2 Member Typedef Documentation

4.749.2.1 `template<typename _Container> typedef _Container std::insert_iterator<_Container>::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 597 of file `stl_iterator.h`.

4.749.2.2 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::difference_type` [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.749.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category` [inherited]

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.749.2.4 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer` [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.749.2.5 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference` [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.749.2.6 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type` [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.749.3 Constructor & Destructor Documentation

4.749.3.1 `template<typename _Container> std::insert_iterator<_Container>::insert_iterator (_Container & __x, typename _Container::iterator __i)` [inline]

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

Definition at line 603 of file `stl_iterator.h`.

4.749.4 Member Function Documentation

4.749.4.1 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator* ()`
`[inline]`

Simply returns `*this`.

Definition at line 657 of file `stl_iterator.h`.

4.749.4.2 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator++ ()`
`[inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 662 of file `stl_iterator.h`.

4.749.4.3 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator++ (int)`
`[inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 667 of file `stl_iterator.h`.

4.749.4.4 `template<typename _Container> insert_iterator& std::insert_iterator< _Container >::operator= (const`
`typename _Container::value_type & __value) [inline]`

Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to- <code>const T</code> for <code>container<T></code> .
----------------------	---

Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
* // vector v contains A and Z
*
* insert_iterator i (v, ++v.begin());
* i = 1;
* i = 2;
* i = 3;
*
* // vector v contains A, 1, 2, 3, and Z
*
```

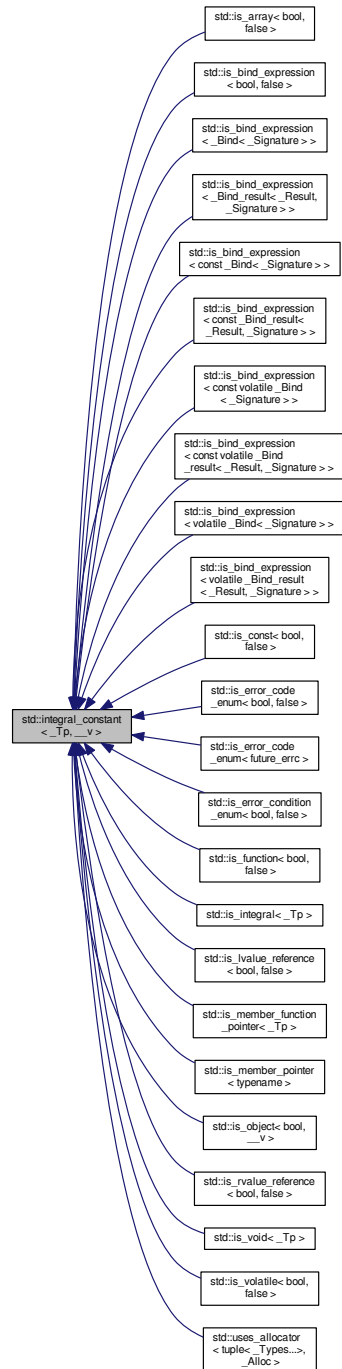

Definition at line 639 of file `stl_iterator.h`.

4.751.1 Detailed Description

Thrown to report invalid arguments to functions.

Definition at line 82 of file `stdexcept`.

4.751.2 Member Function Documentation

4.751.2.1 virtual const char* `std::logic_error::what () const` [virtual], [noexcept], [inherited]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

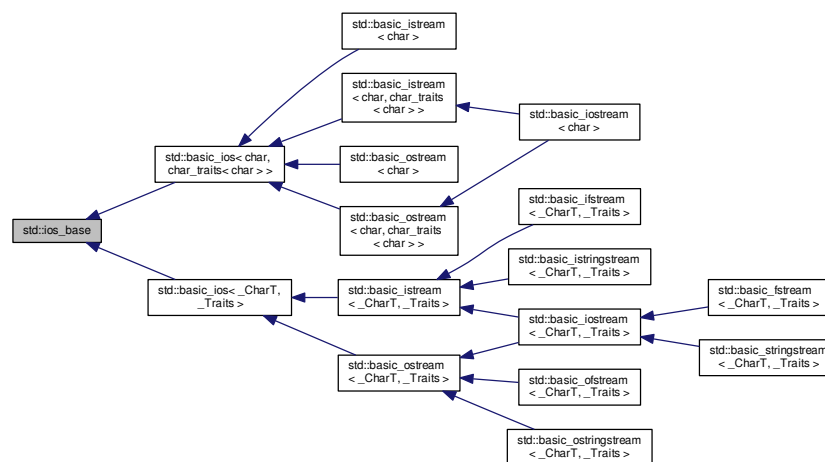

Reimplemented in [std::future_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.752.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

Definition at line 199 of file `ios_base.h`.

4.752.2 Member Typedef Documentation

4.752.2.1 `typedef void(* std::ios_base::event_callback)(event __e, ios_base &__b, int __i)`

The type of an event callback function.

Parameters

<code>__e</code>	One of the members of the event enum.
<code>__b</code>	Reference to the <code>ios_base</code> object.
<code>__i</code>	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several `ios_base` and `basic_ios` functions, specifically `imbue()`, `copyfmt()`, and `~ios()`.

Definition at line 436 of file `ios_base.h`.

4.752.2.2 `typedef _Ios_Fmtflags std::ios_base::fmtflags`

This is a bitmask type.

`_Ios_Fmtflags` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `fmtflags` are:

- `boolalpha`
- `dec`
- `fixed`
- `hex`
- `internal`
- `left`
- `oct`
- `right`
- `scientific`
- `showbase`
- `showpoint`
- `showpos`
- `skipws`
- `unitbuf`

- uppercase
- adjustfield
- basefield
- floatfield

Definition at line 255 of file ios_base.h.

4.752.2.3 typedef _Ios_Iostate std::ios_base::iostate

This is a bitmask type.

_Ios_Iostate is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type iostate are:

- badbit
- eofbit
- failbit
- goodbit

Definition at line 330 of file ios_base.h.

4.752.2.4 typedef _Ios_Openmode std::ios_base::openmode

This is a bitmask type.

_Ios_Openmode is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type openmode are:

- app
- ate
- binary
- in
- out
- trunc

Definition at line 361 of file ios_base.h.

4.752.2.5 typedef _Ios_Seekdir std::ios_base::seekdir

This is an enumerated type.

_Ios_Seekdir is implementation-defined. Defined values of type seekdir are:

- beg
- cur, equivalent to `SEEK_CUR` in the C standard library.
- end, equivalent to `SEEK_END` in the C standard library.

Definition at line 393 of file ios_base.h.

4.752.3 Member Enumeration Documentation

4.752.3.1 enum `std::ios_base::event`

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

Definition at line 419 of file `ios_base.h`.

4.752.4 Constructor & Destructor Documentation

4.752.4.1 virtual `std::ios_base::~ios_base ()` `[virtual]`

Invokes each callback with `erase_event`. Destroys local storage.

Note that the `ios_base` object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with `erase_event` (unless `copyfmt` is used).

4.752.5 Member Function Documentation

4.752.5.1 `const locale& std::ios_base::_M_getloc () const` `[inline]`

Locale access.

Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Definition at line 706 of file `ios_base.h`.

Referenced by `std::money_get<_CharT, _InIter>::do_get()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::time_get<_CharT, _InIter>::do_get_date()`, `std::time_get<_CharT, _InIter>::do_get_monthname()`, `std::time_get<_CharT, _InIter>::do_get_time()`, `std::time_get<_CharT, _InIter>::do_get_weekday()`, `std::time_get<_CharT, _InIter>::do_get_year()`, `std::time_put<_CharT, _OutIter>::do_put()`, `std::num_put<_CharT, _OutIter>::do_put()`, and `std::time_put<_CharT, _OutIter>::put()`.

4.752.5.2 `fmtflags std::ios_base::flags () const` `[inline]`

Access to format flags.

Returns

The format control flags for both input and output.

Definition at line 551 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::copyfmt()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::basic_ostream<_CharT, _Traits>::operator<<()`, `std::operator<<()`, `std::operator>>()`, and `std::basic_istream<_CharT, _Traits>::sentry::sentry()`.

4.752.5.3 `fmtflags std::ios_base::flags (fmtflags __fmtfl)` `[inline]`

Setting new format flags all at once.

Parameters

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

Returns

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

Definition at line 562 of file `ios_base.h`.

4.752.5.4 locale std::ios_base::getloc () const [inline]

Locale access.

Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Definition at line 695 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::copyfmt()`, `std::money_put<_CharT, _Outiter>::do_put()`, `std::operator>>()`, and `std::ws()`.

4.752.5.5 locale std::ios_base::imbue (const locale & __loc) throw ()

Setting a new locale.

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with `imbue_event`.

Referenced by `std::basic_ios<_CharT, _Traits>::imbue()`.

4.752.5.6 long& std::ios_base::iword (int __ix) [inline]

Access to integer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to an integer associated with the index.

The `iword` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 741 of file `ios_base.h`.

4.752.5.7 `streamsize std::ios_base::precision () const` `[inline]`

Flags access.

Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 621 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::copyfmt()`, and `std::operator<<()`.

4.752.5.8 `streamsize std::ios_base::precision (streamsize __prec)` `[inline]`

Changing flags.

Parameters

<code>__prec</code>	The new precision value.
---------------------	--------------------------

Returns

The previous value of `precision()`.

Definition at line 630 of file `ios_base.h`.

4.752.5.9 `void*& std::ios_base::pword (int __ix)` `[inline]`

Access to void pointer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to a `void*` associated with the index.

The `pword` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 762 of file `ios_base.h`.

4.752.5.10 `void std::ios_base::register_callback (event_callback __fn, int __index)`

Add the callback `__fn` with parameter `__index`.

Parameters

<code>__fn</code>	The function to add.
-------------------	----------------------

<code>__index</code>	The integer to pass to the function when invoked.
----------------------	---

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

4.752.5.11 `fmtflags std::ios_base::setf (fmtflags __fmtfl) [inline]`

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 578 of file `ios_base.h`.

Referenced by `std::dec()`, `std::fixed()`, `std::hex()`, `std::left()`, `std::oct()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

4.752.5.12 `fmtflags std::ios_base::setf (fmtflags __fmtfl, fmtflags __mask) [inline]`

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <code>__fmtfl</code> .

Returns

The previous format control flags.

This function clears `mask` in the format flags, then sets `__fmtfl` & `mask`. An example mask is `ios_base::adjustfield`.

Definition at line 595 of file `ios_base.h`.

4.752.5.13 `static bool std::ios_base::sync_with_stdio (bool __sync = true) [static]`

Interaction with the standard C I/O objects.

Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1.html>

4.752.5.14 `void std::ios_base::unsetf (fmtflags __mask) [inline]`

Clearing format flags.

Parameters

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

Definition at line 610 of file `ios_base.h`.

Referenced by `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, and `std::nouppercase()`.

4.752.5.15 `streamsize std::ios_base::width() const` `[inline]`

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.

Definition at line 644 of file `ios_base.h`.

Referenced by `std::basic_ios< _CharT, _Traits >::copyfmt()`, `std::num_put< _CharT, _Outlter >::do_put()`, and `std::operator>>()`.

4.752.5.16 `streamsize std::ios_base::width(streamsize __wide)` `[inline]`

Changing flags.

Parameters

<code>__wide</code>	The new width value.
---------------------	----------------------

Returns

The previous value of `width()`.

Definition at line 653 of file `ios_base.h`.

4.752.5.17 `static int std::ios_base::xalloc() throw` `[static]`

Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

4.752.6 Member Data Documentation

4.752.6.1 `const fmtflags std::ios_base::adjustfield` `[static]`

A mask of left|right|internal. Useful for the 2-arg form of `setf`.

Definition at line 310 of file ios_base.h.

Referenced by std::num_put< _CharT, _OutIter >::do_put(), std::internal(), std::left(), and std::right().

4.752.6.2 const openmode std::ios_base::app [static]

Seek to end before each write.

Definition at line 364 of file ios_base.h.

Referenced by std::basic_filebuf< char_type, traits_type >::_M_set_buffer(), and std::basic_filebuf< _CharT, _Traits >::xspn().

4.752.6.3 const openmode std::ios_base::ate [static]

Open and seek to end immediately after opening.

Definition at line 367 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::open().

4.752.6.4 const iostate std::ios_base::badbit [static]

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file ios_base.h.

Referenced by std::basic_ostream< char >::_M_write(), std::basic_ios< char, char_traits< char > >::bad(), std::basic_ios< char, char_traits< char > >::fail(), std::basic_ostream< _CharT, _Traits >::flush(), std::basic_istream< _CharT, _Traits >::get(), std::basic_istream< _CharT, _Traits >::getline(), std::basic_istream< _CharT, _Traits >::ignore(), std::basic_ostream< _CharT, _Traits >::operator<<(), std::operator<<(), std::basic_istream< _CharT, _Traits >::operator>>(), std::operator>>(), std::basic_istream< _CharT, _Traits >::peek(), std::basic_ostream< _CharT, _Traits >::put(), std::basic_istream< _CharT, _Traits >::putback(), std::basic_istream< _CharT, _Traits >::read(), std::basic_istream< _CharT, _Traits >::readsome(), std::basic_istream< _CharT, _Traits >::seekg(), std::basic_ostream< _CharT, _Traits >::seekp(), std::basic_istream< _CharT, _Traits >::sync(), std::basic_istream< _CharT, _Traits >::tellg(), std::basic_ostream< _CharT, _Traits >::tellp(), std::basic_istream< _CharT, _Traits >::unget(), std::basic_ostream< _CharT, _Traits >::write(), and std::basic_ostream< _CharT, _Traits >::sentry::~sentry().

4.752.6.5 const fmtflags std::ios_base::basefield [static]

A mask of dec|oct|hex. Useful for the 2-arg form of setf.

Definition at line 313 of file ios_base.h.

Referenced by std::dec(), std::num_get< _CharT, _InIter >::do_get(), std::hex(), std::oct(), and std::basic_ostream< _CharT, _Traits >::operator<<().

4.752.6.6 const seekdir std::ios_base::beg [static]

Request a seek relative to the beginning of the stream.

Definition at line 396 of file ios_base.h.

Referenced by std::basic_filebuf< _CharT, _Traits >::seekpos().

4.752.6.7 const openmode std::ios_base::binary [static]

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html>.

Definition at line 372 of file ios_base.h.

Referenced by `std::basic_filebuf< _CharT, _Traits >::showmanyc()`.

4.752.6.8 `const fmtflags std::ios_base::boolalpha` [static]

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file `ios_base.h`.

Referenced by `std::boolalpha()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_put()`, and `std::noboolalpha()`.

4.752.6.9 `const seekdir std::ios_base::cur` [static]

Request a seek relative to the current position within the sequence.

Definition at line 399 of file `ios_base.h`.

Referenced by `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_filebuf< _CharT, _Traits >::seekoff()`, `std::basic_istream< _CharT, _Traits >::tellg()`, and `std::basic_ostream< _CharT, _Traits >::tellp()`.

4.752.6.10 `const fmtflags std::ios_base::dec` [static]

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file `ios_base.h`.

Referenced by `std::dec()`.

4.752.6.11 `const seekdir std::ios_base::end` [static]

Request a seek relative to the current end of the sequence.

Definition at line 402 of file `ios_base.h`.

Referenced by `std::basic_filebuf< _CharT, _Traits >::open()`, and `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`.

4.752.6.12 `const iostate std::ios_base::eofbit` [static]

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file `ios_base.h`.

Referenced by `std::num_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get_date()`, `std::time_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_time()`, `std::time_get< _CharT, _InIter >::do_get_weekday()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_ios< char, char_traits< char > >::eof()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::getline()`, `std::basic_istream< _CharT, _Traits >::ignore()`, `std::basic_istream< _CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_istream< _CharT, _Traits >::peek()`, `std::basic_istream< _CharT, _Traits >::putback()`, `std::basic_istream< _CharT, _Traits >::read()`, `std::basic_istream< _CharT, _Traits >::readsome()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_istream< _CharT, _Traits >::sentry::sentry()`, `std::basic_istream< _CharT, _Traits >::unget()`, and `std::ws()`.

4.752.6.13 `const iostate std::ios_base::failbit` [static]

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file `ios_base.h`.

Referenced by `std::basic_ifstream< _CharT, _Traits >::close()`, `std::basic_ofstream< _CharT, _Traits >::close()`, `std-`

`::basic_fstream< _CharT, _Traits >::close()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_weekday()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_ios< char, char_traits< char > >::fail()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::getline()`, `std::basic_ifstream< _CharT, _Traits >::open()`, `std::basic_ofstream< _CharT, _Traits >::open()`, `std::basic_fstream< _CharT, _Traits >::open()`, `std::basic_ostream< _CharT, _Traits >::operator<<()`, `std::basic_istream< _CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_istream< _CharT, _Traits >::read()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_ostream< _CharT, _Traits >::seekp()`, `std::basic_ostream< _CharT, _Traits >::sentry::sentry()`, and `std::basic_istream< _CharT, _Traits >::sentry::sentry()`.

4.752.6.14 `const fmtflags std::ios_base::fixed` [static]

Generate floating-point output in fixed-point notation.

Definition at line 264 of file `ios_base.h`.

Referenced by `std::fixed()`.

4.752.6.15 `const fmtflags std::ios_base::floatfield` [static]

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Definition at line 316 of file `ios_base.h`.

Referenced by `std::fixed()`, and `std::scientific()`.

4.752.6.16 `const iostate std::ios_base::goodbit` [static]

Indicates all is well.

Definition at line 345 of file `ios_base.h`.

Referenced by `std::num_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_weekday()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_ostream< _CharT, _Traits >::flush()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::getline()`, `std::basic_istream< _CharT, _Traits >::ignore()`, `std::basic_ostream< _CharT, _Traits >::operator<<()`, `std::basic_istream< _CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_istream< _CharT, _Traits >::peek()`, `std::basic_ostream< _CharT, _Traits >::put()`, `std::basic_istream< _CharT, _Traits >::putback()`, `std::basic_istream< _CharT, _Traits >::read()`, `std::basic_istream< _CharT, _Traits >::readsome()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_ostream< _CharT, _Traits >::seekp()`, `std::basic_istream< _CharT, _Traits >::sentry::sentry()`, `std::basic_istream< _CharT, _Traits >::sync()`, and `std::basic_istream< _CharT, _Traits >::unget()`.

4.752.6.17 `const fmtflags std::ios_base::hex` [static]

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file `ios_base.h`.

Referenced by `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_put()`, `std::hex()`, and `std::basic_ostream< _CharT, _Traits >::operator<<()`.

4.752.6.18 `const openmode std::ios_base::in` [static]

Open for input. Default for `ifstream` and `fstream`.

Definition at line 375 of file `ios_base.h`.

Referenced by `std::basic_filebuf< char_type, traits_type >::M_set_buffer()`, `std::basic_ifstream< _CharT, _Traits >::open()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekpos()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::showmanyc()`, `std::basic_filebuf< _CharT, _Traits >::showmanyc()`, `std::basic_istream< _CharT, _Traits >::tellg()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::underflow()`, `std::basic_filebuf< _CharT, _Traits >::underflow()`, and `std::basic_`

`filebuf< _CharT, _Traits >::xsgetn()`.

4.752.6.19 `const fmtflags std::ios_base::internal` [static]

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file `ios_base.h`.

Referenced by `std::internal()`.

4.752.6.20 `const fmtflags std::ios_base::left` [static]

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file `ios_base.h`.

Referenced by `std::num_put< _CharT, _Outiter >::do_put()`, and `std::left()`.

4.752.6.21 `const fmtflags std::ios_base::oct` [static]

Converts integer input or generates integer output in octal base.

Definition at line 279 of file `ios_base.h`.

Referenced by `std::oct()`, and `std::basic_ostream< _CharT, _Traits >::operator<<()`.

4.752.6.22 `const openmode std::ios_base::out` [static]

Open for output. Default for `ofstream` and `fstream`.

Definition at line 378 of file `ios_base.h`.

Referenced by `std::basic_filebuf< char_type, traits_type >::M_set_buffer()`, `std::basic_ofstream< _CharT, _Traits >::open()`, `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`, `std::basic_ostream< _CharT, _Traits >::seekp()`, `std::basic_ostream< _CharT, _Traits >::tellp()`, and `std::basic_filebuf< _CharT, _Traits >::xsputn()`.

4.752.6.23 `const fmtflags std::ios_base::right` [static]

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file `ios_base.h`.

Referenced by `std::right()`.

4.752.6.24 `const fmtflags std::ios_base::scientific` [static]

Generates floating-point output in scientific notation.

Definition at line 286 of file `ios_base.h`.

Referenced by `std::scientific()`.

4.752.6.25 `const fmtflags std::ios_base::showbase` [static]

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file `ios_base.h`.

Referenced by `std::noshowbase()`, and `std::showbase()`.

4.752.6.26 `const fmtflags std::ios_base::showpoint` [static]

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file ios_base.h.

Referenced by std::noshowpoint(), and std::showpoint().

4.752.6.27 const fmtflags std::ios_base::showpos [static]

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file ios_base.h.

Referenced by std::noshowpos(), and std::showpos().

4.752.6.28 const fmtflags std::ios_base::skipws [static]

Skips leading white space before certain input operations.

Definition at line 300 of file ios_base.h.

Referenced by std::noskipws(), std::basic_istream<_CharT, _Traits>::sentry::sentry(), and std::skipws().

4.752.6.29 const openmode std::ios_base::trunc [static]

Open for input. Default for ofstream.

Definition at line 381 of file ios_base.h.

4.752.6.30 const fmtflags std::ios_base::unitbuf [static]

Flushes output after each output operation.

Definition at line 303 of file ios_base.h.

Referenced by std::nounitbuf(), std::unitbuf(), and std::basic_ostream<_CharT, _Traits>::sentry::~sentry().

4.752.6.31 const fmtflags std::ios_base::uppercase [static]

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file ios_base.h.

Referenced by std::num_put<_CharT, _Outlter>::do_put(), std::nouppercase(), and std::uppercase().

The documentation for this class was generated from the following file:

4.753 `std::ios_base::failure` Class Reference

Inheritance diagram for `std::ios_base::failure`:

Public Member Functions

- **failure** (const [string](#) &__str) throw ()
- virtual const char * [what](#) () const throw ()

4.753.1 Detailed Description

These are thrown to indicate problems with io.

27.4.2.1.1 Class `ios_base::failure`.

Definition at line 209 of file `ios_base.h`.

4.753.2 Member Function Documentation

4.753.2.1 virtual const char* `std::ios_base::failure::what () const throw ()` [virtual]

Returns a C-style character string describing the general cause of the current error.

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [ios_base.h](#)

4.754 `std::is_abstract<_Tp>` Struct Template Reference

Inheritance diagram for `std::is_abstract<_Tp>`:

Public Types

- typedef [integral_constant](#)
 < bool, __v > **type**
- typedef bool **value_type**

Public Member Functions

- constexpr **operator value_type** () const

Static Public Attributes

- static constexpr bool **value**

4.754.1 Detailed Description

```
template<typename _Tp>struct std::is_abstract<_Tp>
```

`is_abstract`

Definition at line 627 of file `type_traits`.

The documentation for this struct was generated from the following file:

- [type_traits](#)

4.755 `std::is_arithmetic<_Tp>` Struct Template Reference

Inherits type< `is_integral<_Tp>`, `is_floating_point<_Tp>` > >.

4.755.1 Detailed Description

```
template<typename _Tp>struct std::is_arithmetic< _Tp >
```

is_arithmetic

Definition at line 502 of file type_traits.

The documentation for this struct was generated from the following file:

4.798.1 Detailed Description

`template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t> class std::istream_iterator<_Tp, _CharT, _Traits, _Dist>`

Provides input iterator semantics for streams.

Definition at line 49 of file `stream_iterator.h`.

4.798.2 Member Typedef Documentation

4.798.2.1 `typedef _Dist std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::difference_type`
[*inherited*]

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.798.2.2 `typedef input_iterator_tag std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::iterator_category` [*inherited*]

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.798.2.3 `typedef const _Tp * std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::pointer`
[*inherited*]

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.798.2.4 `typedef const _Tp & std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::reference`
[*inherited*]

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.798.2.5 `typedef _Tp std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::value_type`
[*inherited*]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.798.3 Constructor & Destructor Documentation

4.798.3.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t> constexpr std::istream_iterator<_Tp, _CharT, _Traits, _Dist>::istream_iterator ()` [*inline*]

Construct end of input stream iterator.

Definition at line 64 of file `stream_iterator.h`.

4.798.3.2 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
std::istream_iterator<_Tp, _CharT, _Traits, _Dist>::istream_iterator (istream_type & __s) [inline]`

Construct start of input stream iterator.

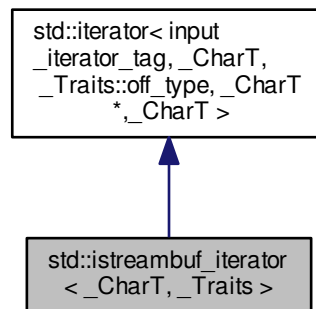

Definition at line 68 of file `stream_iterator.h`.

The documentation for this class was generated from the following file:

- [stream_iterator.h](#)

4.799 std::istreambuf_iterator<_CharT, _Traits> Class Template Reference

4.799.1 Detailed Description

template<typename _CharT, typename _Traits = char_traits<_CharT>> class std::istreambuf_iterator<_CharT, _Traits>

Provides input iterator semantics for streambufs.

Definition at line 120 of file iosfwd.

4.799.2 Member Typedef Documentation

4.799.2.1 template<typename _CharT, typename _Traits = char_traits<_CharT>> typedef _CharT std::istreambuf_iterator<_CharT, _Traits>::char_type

Public typedefs.

Definition at line 64 of file streambuf_iterator.h.

4.799.2.2 template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&> typedef _Distance std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>::difference_type [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.799.2.3 `template<typename _CharT, typename _Traits = char_traits<_CharT>> typedef _Traits::int_type
std::istreambuf_iterator<_CharT, _Traits>::int_type`

Public typedefs.

Definition at line 66 of file `streambuf_iterator.h`.

4.799.2.4 `template<typename _CharT, typename _Traits = char_traits<_CharT>> typedef basic_istream<_CharT, _Traits>
std::istreambuf_iterator<_CharT, _Traits>::istream_type`

Public typedefs.

Definition at line 68 of file `streambuf_iterator.h`.

4.799.2.5 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp> typedef _Category std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference
>::iterator_category [inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.799.2.6 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename
_Reference = _Tp> typedef _Pointer std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>::pointer
[inherited]`

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.799.2.7 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename
_Reference = _Tp> typedef _Reference std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>::reference
[inherited]`

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.799.2.8 `template<typename _CharT, typename _Traits = char_traits<_CharT>> typedef basic_streambuf<_CharT, _Traits>
std::istreambuf_iterator<_CharT, _Traits>::streambuf_type`

Public typedefs.

Definition at line 67 of file `streambuf_iterator.h`.

4.799.2.9 `template<typename _CharT, typename _Traits = char_traits<_CharT>> typedef _Traits std::istreambuf_iterator<
_CharT, _Traits>::traits_type`

Public typedefs.

Definition at line 65 of file `streambuf_iterator.h`.

4.799.2.10 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename
_Reference = _Tp> typedef _Tp std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>::value_type
[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.799.3 Constructor & Destructor Documentation

4.799.3.1 `template<typename _CharT, typename _Traits = char_traits<_CharT>> constexpr std::istreambuf_iterator<_CharT, _Traits>::istreambuf_iterator() [inline], [noexcept]`

Construct end of input stream iterator.

Definition at line 102 of file streambuf_iterator.h.

4.799.3.2 `template<typename _CharT, typename _Traits = char_traits<_CharT>> std::istreambuf_iterator<_CharT, _Traits>::istreambuf_iterator(istream_type &__s) [inline], [noexcept]`

Construct start of input stream iterator.

Definition at line 112 of file streambuf_iterator.h.

4.799.3.3 `template<typename _CharT, typename _Traits = char_traits<_CharT>> std::istreambuf_iterator<_CharT, _Traits>::istreambuf_iterator(streambuf_type *__s) [inline], [noexcept]`

Construct start of streambuf iterator.

Definition at line 116 of file streambuf_iterator.h.

4.799.4 Member Function Documentation

4.799.4.1 `template<typename _CharT, typename _Traits = char_traits<_CharT>> bool std::istreambuf_iterator<_CharT, _Traits>::equal(const istreambuf_iterator<_CharT, _Traits> &__b) const [inline]`

Return true both iterators are end or both are not end.

Definition at line 172 of file streambuf_iterator.h.

4.799.4.2 `template<typename _CharT, typename _Traits = char_traits<_CharT>> char_type std::istreambuf_iterator<_CharT, _Traits>::operator*() const [inline]`

Return the current character pointed to by iterator. This returns streambuf.sgetc(). It cannot be assigned. NB: The result of operator*() on an end of stream is undefined.

Definition at line 123 of file streambuf_iterator.h.

4.799.4.3 `template<typename _CharT, typename _Traits = char_traits<_CharT>> istreambuf_iterator& std::istreambuf_iterator<_CharT, _Traits>::operator++() [inline]`

Advance the iterator. Calls streambuf.sbumpc().

Definition at line 137 of file streambuf_iterator.h.

References std::basic_streambuf<_CharT, _Traits>::sbumpc().

4.799.4.4 `template<typename _CharT, typename _Traits = char_traits<_CharT>> istreambuf_iterator std::istreambuf_iterator<_CharT, _Traits>::operator++(int) [inline]`

Advance the iterator. Calls streambuf.sbumpc().

Definition at line 152 of file streambuf_iterator.h.

References std::basic_streambuf<_CharT, _Traits>::sbumpc().

The documentation for this class was generated from the following files:

- [iosfwd](#)
- [streambuf_iterator.h](#)

4.800 std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference > Struct Template Reference

Inheritance diagram for std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >:

Public Types

- typedef _Distance [difference_type](#)
- typedef _Category [iterator_category](#)
- typedef _Pointer [pointer](#)
- typedef _Reference [reference](#)
- typedef _Tp [value_type](#)

4.800.1 Detailed Description

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference =
_Tp&>struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >
```

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

Definition at line 118 of file `stl_iterator_base_types.h`.

4.800.2 Member Typedef Documentation

4.800.2.1 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&> typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.800.2.2 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,
typename _Reference = _Tp&> typedef _Category std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference
>::iterator_category`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.800.2.3 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename
_Reference = _Tp&> typedef _Pointer std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference >::pointer`

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.800.2.4 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename
_Reference = _Tp&> typedef _Reference std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference >::reference`

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.800.2.5 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename
_Reference = _Tp&> typedef _Tp std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference >::value_type`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

4.801 `std::iterator_traits<_Tp * >` Struct Template Reference

Public Types

- typedef ptrdiff_t **difference_type**
- typedef [random_access_iterator_tag](#) **iterator_category**
- typedef _Tp * **pointer**
- typedef _Tp & **reference**
- typedef _Tp **value_type**

4.801.1 Detailed Description

`template<typename _Tp>struct std::iterator_traits<_Tp * >`

Partial specialization for pointer types.

Definition at line 175 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

4.802 `std::iterator_traits< const_Tp * >` Struct Template Reference

Public Types

- typedef [random_access_iterator_tag](#) **iterator_category**
- typedef const_Tp * **pointer**
- typedef const_Tp & **reference**
- typedef _Tp **value_type**

4.802.1 Detailed Description

```
template<typename _Tp>struct std::iterator_traits< const_Tp * >
```

Partial specialization for const pointer types.

Definition at line 186 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

4.803 `std::length_error` Class Reference

Inheritance diagram for `std::length_error`:

Public Member Functions

- **length_error** (const [string](#) &__arg)
- virtual const char * [what](#) () const noexcept

4.803.1 Detailed Description

Thrown when an object is constructed that would exceed its maximum permitted size (e.g., a `basic_string` instance).

Definition at line 91 of file `stdexcept`.

4.803.2 Member Function Documentation

4.803.2.1 `virtual const char* std::logic_error::what () const` `[virtual]`, `[noexcept]`, `[inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.804 `std::less<_Tp>` Struct Template Reference

Inheritance diagram for `std::less<_Tp>`:

Public Types

`Type1, __a1, __c1, __m1 > &__lcr)`

4.806.1 Detailed Description

```
template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>class std::linear_congruential_engine< _UIntType, _
_a, __c, __m >
```

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to `(__m-1)`. If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Definition at line 241 of file `random.h`.

4.806.2 Member Typedef Documentation

4.806.2.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> typedef _UIntType`
`std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type`

The type of the generated random value.

Definition at line 244 of file random.h.

4.806.3 Constructor & Destructor Documentation

4.806.3.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> std::linear_congruential_engine<_UIntType, __a, __c, __m>::linear_congruential_engine (result_type __s = default_seed)
[inline], [explicit]`

Constructs a linear_congruential_engine random number generator engine with seed __s. The default seed value is 1.

Parameters

<code>__s</code>	The initial seed value.
------------------	-------------------------

Definition at line 268 of file random.h.

References std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

4.806.3.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq ,
typename = typename std::enable_if<!std::is_same<_Sseq, linear_congruential_engine>::value> ::type>
std::linear_congruential_engine< _UIntType, __a, __c, __m>::linear_congruential_engine (_Sseq & __q)
[inline], [explicit]`

Constructs a linear_congruential_engine random number generator engine seeded from the seed sequence __q.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

Definition at line 281 of file random.h.

References std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

4.806.4 Member Function Documentation

4.806.4.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear-
_congruential_engine< _UIntType, __a, __c, __m>::discard (unsigned long long __z)
[inline]`

Discard a sequence of random numbers.

Definition at line 325 of file random.h.

4.806.4.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type
std::linear_congruential_engine< _UIntType, __a, __c, __m>::max () [inline], [static]`

Gets the largest possible value in the output range.

Definition at line 318 of file random.h.

4.806.4.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type
std::linear_congruential_engine< _UIntType, __a, __c, __m>::min () [inline], [static]`

Gets the smallest possible value in the output range.

The minimum depends on the __c parameter: if it is zero, the minimum generated must be > 0, otherwise 0 is allowed.

Definition at line 311 of file random.h.

4.806.4.4 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> result_type
std::linear_congruential_engine<_UIntType, __a, __c, __m>::operator()() [inline]`

Gets the next random number in the sequence.

Definition at line 335 of file random.h.

4.806.4.5 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear_-
congruential_engine<_UIntType, __a, __c, __m>::seed (result_type __s = default_seed
)`

Reseeds the linear_congruential_engine random number generator engine sequence to the seed __s.

Parameters

<code>__s</code>	The new seed.
------------------	---------------

Seeds the LCR with integral value __s, adjusted so that the ring identity is never a member of the convergence set.

Definition at line 120 of file bits/random.tcc.

Referenced by `std::linear_congruential_engine<_UIntType, __a, __c, __m>::linear_congruential_engine()`.

4.806.4.6 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq >
std::enable_if< std::is_class<_Sseq>::value >::type std::linear_congruential_engine<_UIntType, __a, __c,
__m>::seed (_Sseq & __q)`

Reseeds the linear_congruential_engine random number generator engine sequence using values from the seed sequence __q.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

Seeds the LCR engine with a value generated by __q.

Definition at line 136 of file bits/random.tcc.

References `std::__arr`, and `std::__lg()`.

4.806.5 Friends And Related Function Documentation

4.806.5.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename
_UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const
std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> & __lcr) [friend]`

Writes the textual representation of the state x(i) of x to __os.

Parameters

<code>__os</code>	The output stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

Returns

__os.

4.806.5.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> bool operator== (const
linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs, const linear_congruential_engine<
_UIntType, __a, __c, __m > & __rhs) [friend]`

Compares two linear congruential random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 353 of file random.h.

```
4.806.5.3 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename
    _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits >
    std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is,
    std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> & __lcr ) [friend]
```

Sets the state of the engine by reading its textual representation from `__is`.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

Parameters

<code>__is</code>	The input stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

Returns

`__is`.

4.806.6 Member Data Documentation

```
4.806.6.1 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr _UIntType
    std::linear_congruential_engine<_UIntType, __a, __c, __m>::increment [static]
```

An increment.

Definition at line 255 of file random.h.

```
4.806.6.2 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr _UIntType
    std::linear_congruential_engine<_UIntType, __a, __c, __m>::modulus [static]
```

The modulus.

Definition at line 257 of file random.h.

```
4.806.6.3 template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr _UIntType
    std::linear_congruential_engine<_UIntType, __a, __c, __m>::multiplier [static]
```

The multiplier.

Definition at line 253 of file random.h.

4.807.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class std::list< _Tp, _Alloc >`

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X,Alloc1>` are spliced into `list<X,Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

```
*   A <----> B <----> C <----> D
*
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's `next/previous` pointers refer to itself, the list is empty.

Definition at line 447 of file `stl_list.h`.

4.807.2 Constructor & Destructor Documentation

4.807.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc >::list (const allocator_type &__a = allocator_type()) [inline], [explicit], [noexcept]`

Creates a list with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 534 of file `stl_list.h`.

4.807.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (size_type __n)`
`[inline], [explicit]`

Creates a list with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor fills the list with `__n` default constructed elements.

Definition at line 546 of file `stl_list.h`.

4.807.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (size_type __n,`
`const value_type & __value, const allocator_type & __a = allocator_type()) [inline]`

Creates a list with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator object.

This constructor fills the list with `__n` copies of `__value`.

Definition at line 558 of file `stl_list.h`.

4.807.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (const list<_Tp,`
`_Alloc> & __x) [inline]`

List copy constructor.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The newly-created list uses a copy of the allocation object used by `__x`.

Definition at line 585 of file `stl_list.h`.

4.807.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (list<_Tp, _Alloc`
`> && __x) [inline], [noexcept]`

List move constructor.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The newly-created list contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified list.

Definition at line 597 of file `stl_list.h`.

4.807.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list (initializer_list<`
`value_type > __l, const allocator_type & __a = allocator_type()) [inline]`

Builds a list from an `initializer_list`.

Parameters

<code>__l</code>	An initializer_list of value_type.
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements in the initializer_list `__l`. This is linear in `__l.size()`.

Definition at line 608 of file `stl_list.h`.

```
4.807.2.7  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std::RequireInputIter<_InputIterator>>> std::list<_Tp, _Alloc>::list ( _InputIterator __first, _InputIterator __last,
const allocator_type & __a = allocator_type() ) [inline]
```

Builds a list from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements from `[__first, __last)`. This is linear in N (where N is `distance(__first, __last)`).

Definition at line 627 of file `stl_list.h`.

4.807.3 Member Function Documentation

```
4.807.3.1  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> _Node* std::list<
_Tp, _Alloc>::M_create_node ( _Args &&... __args ) [inline], [protected]
```

Parameters

<code>__args</code>	An instance of user data.
---------------------	---------------------------

Allocates space for a new node and constructs a copy of `__args` in it.

Definition at line 509 of file `stl_list.h`.

```
4.807.3.2  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::assign ( size_type
__n, const value_type & __val ) [inline]
```

Assigns a given value to a list.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a list with `__n` copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 705 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::assign()`, and `std::list< __inp, __rebind_inp >::operator=()`.

```
4.807.3.3  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std::RequireInputIter<_InputIterator>>> void std::list<_Tp, _Alloc>::assign ( _InputIterator __first, _InputIterator
__last ) [inline]
```

Assigns a range to a list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 724 of file `stl_list.h`.

4.807.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::assign (initializer_list<value_type> __l) [inline]`

Assigns an `initializer_list` to a list.

Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
------------------	---

Replace the contents of the list with copies of the elements in the `initializer_list __l`. This is linear in `__l.size()`.

Definition at line 746 of file `stl_list.h`.

4.807.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list<_Tp, _Alloc>::back () [inline], [noexcept]`

Returns a read/write reference to the data at the last element of the list.

Definition at line 946 of file `stl_list.h`.

4.807.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list<_Tp, _Alloc>::back () const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the list.

Definition at line 958 of file `stl_list.h`.

4.807.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 761 of file `stl_list.h`.

Referenced by `std::list<__inp, __rebind_inp>::crend()`, `std::list<__inp, __rebind_inp>::front()`, `std::list<_Tp, _Alloc>::insert()`, `std::list<__inp, __rebind_inp>::list()`, `std::list<_Tp, _Alloc>::operator=()`, `std::operator==()`, `std::list<__inp, __rebind_inp>::pop_front()`, `std::list<__inp, __rebind_inp>::push_front()`, `std::list<__inp, __rebind_inp>::rend()`, `std::list<__inp, __rebind_inp>::size()`, `std::list<_Tp, _Alloc>::sort()`, and `std::list<__inp, __rebind_inp>::splice()`.

4.807.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 770 of file `stl_list.h`.

4.807.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 834 of file `stl_list.h`.

4.807.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 843 of file `stl_list.h`.

4.807.3.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::clear () [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1292 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::operator=()`.

4.807.3.12 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 852 of file `stl_list.h`.

4.807.3.13 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 861 of file `stl_list.h`.

4.807.3.14 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator std::list<_Tp, _Alloc>::emplace (const_iterator __position, _Args &&... __args)`

Constructs object in list before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.`

Referenced by `std::list< __inp, __rebind_inp >::insert()`.

4.807.3.15 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::list< _Tp, _Alloc >::empty () const`
`[inline], [noexcept]`

Returns true if the list is empty. (Thus `begin()` would equal `end()`.)

Definition at line 871 of file `stl_list.h`.

Referenced by `std::list< _Tp, _Alloc >::sort()`, and `std::list< __inp, __rebind_inp >::splice()`.

4.807.3.16 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 779 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::back()`, `std::list< __inp, __rebind_inp >::cbegin()`, `std::list< __inp, __rebind_inp >::list()`, `std::list< _Tp, _Alloc >::operator=()`, `std::operator==()`, `std::list< __inp, __rebind_inp >::push-back()`, `std::list< __inp, __rebind_inp >::rbegin()`, `std::list< __inp, __rebind_inp >::size()`, and `std::list< __inp, __rebind_inp >::splice()`.

4.807.3.17 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list< _Tp, _Alloc >::end () const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 788 of file `stl_list.h`.

4.807.3.18 `template<typename _Tp, typename _Alloc > list< _Tp, _Alloc >::iterator list::erase (const_iterator __position)`
`[noexcept]`

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 148 of file `list.tcc`.

Referenced by `std::list< __inp, __rebind_inp >::erase()`.

4.807.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::erase (const_iterator __first, const_iterator __last)` `[inline], [noexcept]`

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or `end()`).

This function will erase the elements in the range `[first,last)` and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1254 of file `stl_list.h`.

4.807.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list<_Tp, _Alloc>::front ()`
`[inline], [noexcept]`

Returns a read/write reference to the data at the first element of the list.

Definition at line 930 of file `stl_list.h`.

4.807.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list<_Tp, _Alloc>::front () const`
`[inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the list.

Definition at line 938 of file `stl_list.h`.

4.807.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::list<_Tp, _Alloc>::get_allocator () const`
`[inline], [noexcept]`

Get a copy of the memory allocation object.

Definition at line 752 of file `stl_list.h`.

4.807.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __position, const value_type & __x)`

Inserts given value into list before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Referenced by `std::list< __inp, __rebind_inp >::insert()`.

4.807.3.24 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __position, value_type && __x) [inline]`

Inserts given rvalue into list before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1106 of file `stl_list.h`.

4.807.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __p, initializer_list<value_type> __l) [inline]`

Inserts the contents of an `initializer_list` into list before specified `const_iterator`.

Parameters

<code>__p</code>	A const_iterator into the list.
<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the `initializer_list l` into the list before the location specified by `p`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1125 of file `stl_list.h`.

4.807.3.26 `template<typename _Tp, typename _Alloc> list<_Tp, _Alloc>::iterator list::insert (const_iterator __position, size_type __n, const value_type & __x)`

Inserts a number of copies of given data into the list.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert a specified number of copies of the given data before the location specified by `position`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 114 of file `list.tcc`.

References `std::list<_Tp, _Alloc>::begin()`.

4.807.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> iterator std::list<_Tp, _Alloc>::insert (const_iterator __position, _InputIterator __first, _InputIterator __last)`

Inserts a range into the list.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the range *[first,last)* into the list before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

4.807.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list<_Tp, _Alloc>::max_size ()`
`const [inline],[noexcept]`

Returns the size() of the largest possible list.

Definition at line 881 of file `stl_list.h`.

4.807.3.29 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::merge (list<_Tp, _Alloc> && __x)`

Merge sorted lists.

Parameters

<code>__x</code>	Sorted list to merge.
------------------	-----------------------

Assumes that both `__x` and this list are sorted according to `operator<()`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

Referenced by `std::list<_Tp, _Alloc>::sort()`.

4.807.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _StrictWeakOrdering > void std::list<_Tp, _Alloc>::merge (list<_Tp, _Alloc> && __x, _StrictWeakOrdering __comp)`

Merge sorted lists according to comparison function.

Template Parameters

<code>_StrictWeakOrdering</code>	Comparison function defining sort order.
----------------------------------	--

Parameters

<code>__x</code>	Sorted list to merge.
<code>__comp</code>	Comparison functor.

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

4.807.3.31 `template<typename _Tp, typename _Alloc > list<_Tp, _Alloc> & list::operator= (const list<_Tp, _Alloc> & __x)`

List assignment operator.

No explicit dtor needed as the `_Base` dtor takes care of things. The `_Base` dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 227 of file `list.tcc`.

References `std::begin()`, `std::list< _Tp, _Alloc >::begin()`, `std::end()`, and `std::list< _Tp, _Alloc >::end()`.

4.807.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list< _Tp, _Alloc >::operator= (list< _Tp, _Alloc > && __x) [inline]`

List move assignment operator.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this list (without copying). `__x` is a valid, but unspecified list

Definition at line 670 of file `stl_list.h`.

4.807.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list< _Tp, _Alloc >::operator= (initializer_list< value_type > __l) [inline]`

List initializer list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
------------------	---

Replace the contents of the list with copies of the elements in the `initializer_list __l`. This is linear in `l.size()`.

Definition at line 687 of file `stl_list.h`.

4.807.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::pop_back () [inline], [noexcept]`

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1044 of file `stl_list.h`.

4.807.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::pop_front () [inline], [noexcept]`

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1004 of file `stl_list.h`.

4.807.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::push_back (const value_type & __x) [inline]`

Add data to the end of the list.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1018 of file `stl_list.h`.

4.807.3.37 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::push_front (const value_type & __x) [inline]`

Add data to the front of the list.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 977 of file `stl_list.h`.

4.807.3.38 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list<_Tp, _Alloc>::rbegin () [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 797 of file `stl_list.h`.

4.807.3.39 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 806 of file `stl_list.h`.

4.807.3.40 `template<typename _Tp, typename _Alloc > void list::remove (const _Tp & __value)`

Remove all elements equal to *value*.

Parameters

<code>__value</code>	The value to remove.
----------------------	----------------------

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 281 of file `list.tcc`.

References `std::__addressof()`, `std::begin()`, and `std::end()`.

4.807.3.41 `template<typename _Tp, typename _Alloc > template<typename _Predicate > void list::remove_if (_Predicate __pred)`

Remove all elements satisfying a predicate.

Template Parameters

<i>_Predicate</i>	Unary predicate function or object.
-------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 434 of file list.tcc.

References std::begin(), and std::end().

4.807.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list< _Tp, _Alloc >::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 815 of file stl_list.h.

4.807.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list< _Tp, _Alloc >::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 824 of file stl_list.h.

4.807.3.44 `template<typename _Tp, typename _Alloc > void list::resize (size_type __new_size)`

Resizes the list to the specified number of elements.

Parameters

<i>__new_size</i>	Number of elements the list should contain.
-------------------	---

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

Definition at line 181 of file list.tcc.

References std::begin(), and std::end().

4.807.3.45 `template<typename _Tp, typename _Alloc > void list::resize (size_type __new_size, const value_type & __x)`

Resizes the list to the specified number of elements.

Parameters

<i>__new_size</i>	Number of elements the list should contain.
<i>__x</i>	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

Definition at line 196 of file list.tcc.

References std::begin(), and std::end().

4.807.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::reverse () [inline], [noexcept]`

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1566 of file `stl_list.h`.

4.807.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list<_Tp, _Alloc>::size () const`
`[inline], [noexcept]`

Returns the number of elements in the list.

Definition at line 876 of file `stl_list.h`.

4.807.3.48 `template<typename _Tp, typename _Alloc > void list::sort ()`

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 396 of file `list.tcc`.

References `std::begin()`, `std::list<_Tp, _Alloc>::begin()`, `std::list<_Tp, _Alloc>::empty()`, `std::list<_Tp, _Alloc>::merge()`, `std::list<_Tp, _Alloc>::splice()`, `std::list<_Tp, _Alloc>::swap()`, and `std::swap()`.

4.807.3.49 `template<typename _Tp, typename _Alloc > template<typename _StrictWeakOrdering > void list::sort (`
`_StrictWeakOrdering __comp)`

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 473 of file `list.tcc`.

References `std::begin()`, `std::list<_Tp, _Alloc>::begin()`, `std::list<_Tp, _Alloc>::empty()`, `std::list<_Tp, _Alloc>::merge()`, `std::list<_Tp, _Alloc>::splice()`, `std::list<_Tp, _Alloc>::swap()`, and `std::swap()`.

4.807.3.50 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (`
`const_iterator __position, list<_Tp, _Alloc> && __x) [inline], [noexcept]`

Insert contents of another list.

Parameters

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this `!= __x`.

Definition at line 1312 of file `stl_list.h`.

Referenced by `std::list<_Tp, _Alloc>::sort()`, and `std::list<__inp, __rebind_inp>::splice()`.

4.807.3.51 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (`
`const_iterator __position, list<_Tp, _Alloc> && __x, const_iterator __i) [inline], [noexcept]`

Insert element from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
-------------------------	--

<code>__x</code>	Source list.
<code>__i</code>	Const_iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1344 of file `stl_list.h`.

4.807.3.52 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (const_iterator __position, list<_Tp, _Alloc> & __x, const_iterator __i) [inline], [noexcept]`

Insert element from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Const_iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1383 of file `stl_list.h`.

4.807.3.53 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (const_iterator __position, list<_Tp, _Alloc> && __x, const_iterator __first, const_iterator __last) [inline], [noexcept]`

Insert range from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first,__last)`.

Definition at line 1402 of file `stl_list.h`.

4.807.3.54 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::splice (const_iterator __position, list<_Tp, _Alloc> & __x, const_iterator __first, const_iterator __last) [inline], [noexcept]`

Insert range from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first,__last)`.

Definition at line 1448 of file `stl_list.h`.

4.807.3.55 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::swap (list<_Tp, _Alloc> & __x) [inline]`

Swaps data with another list.

Parameters

<code>__x</code>	A list of the same element and allocator types.
------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Definition at line 1274 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::operator=()`, `std::list< _Tp, _Alloc >::sort()`, and `std::swap()`.

4.807.3.56 `template<typename _Tp, typename _Alloc > void list::unique ()`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 309 of file `list.tcc`.

References `std::begin()`, and `std::end()`.

4.807.3.57 `template<typename _Tp, typename _Alloc > template<typename _BinaryPredicate > void list::unique (_BinaryPredicate __binary_pred)`

Remove consecutive elements satisfying a predicate.

Template Parameters

<code>__BinaryPredicate</code>	Binary predicate function or object.
--------------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 452 of file `list.tcc`.

References `std::begin()`, and `std::end()`.

4.808.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

Definition at line 62 of file locale_classes.h.

4.808.2 Member Typedef Documentation

4.808.2.1 typedef int std::locale::category

Definition of locale::category.

Definition at line 67 of file locale_classes.h.

4.808.3 Constructor & Destructor Documentation

4.808.3.1 std::locale::locale () throw

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by combine().

4.808.3.2 std::locale::locale (const locale & __other) throw

Copy constructor.

Constructs a copy of *other*.

Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

4.808.3.3 std::locale::locale (const char * __s) [explicit]

Named locale constructor.

Constructs a copy of the named C library locale.

Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

4.808.3.4 std::locale::locale (const locale & __base, const char * __s, category __cat)

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

4.808.3.5 std::locale::locale (const locale & __base, const locale & __add, category __cat)

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__add</code>	The locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <i>add</i> .

4.808.3.6 template<typename _Facet > std::locale::locale (const locale & __other, _Facet * __f)

Construct locale with another facet.

Constructs a copy of the locale `__other`. The facet `__f` is added to `__other`, replacing an existing facet of type `Facet` if there is one. If `__f` is null, this locale is a copy of `__other`.

Parameters

<code>__other</code>	The locale to copy.
<code>__f</code>	The facet to add in.

Definition at line 45 of file `locale_classes.tcc`.

4.808.3.7 std::locale::~~locale () throw ()

Locale destructor.

4.808.4 Member Function Documentation

4.808.4.1 static const locale& std::locale::classic () [static]

Return reference to the C locale.

4.808.4.2 template<typename _Facet > locale std::locale::combine (const locale & __other) const

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type `Facet` from the locale *other* into the new locale.

Template Parameters

<code>__Facet</code>	The facet type to copy from other
----------------------	-----------------------------------

Parameters

<code>__other</code>	The locale to copy from.
----------------------	--------------------------

Returns

Newly constructed locale.

Exceptions

<code>std::runtime_error</code>	if <code>__other</code> has no facet of type <code>__Facet</code> .
---------------------------------	---

Definition at line 63 of file `locale_classes.tcc`.

References `locale()`.

4.808.4.3 `static locale std::locale::global (const locale & __loc) [static]`

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

Parameters

<code>__loc</code>	The new locale to make global.
--------------------	--------------------------------

Returns

Copy of the old global locale.

4.808.4.4 `string std::locale::name () const`

Return locale name.

Returns

Locale name or "*" if unnamed.

4.808.4.5 `bool std::locale::operator!=(const locale & __other) const throw () [inline]`

Locale inequality.

Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

Returns

`! (*this == __other)`

Definition at line 235 of file `locale_classes.h`.

References `operator==()`.

4.808.4.6 `template<typename _Char, typename _Traits, typename _Alloc> bool std::locale::operator() (const basic_string<_Char, _Traits, _Alloc> & __s1, const basic_string<_Char, _Traits, _Alloc> & __s2) const`

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector *v* of strings could be sorted according to locale *loc* by doing:

```
* std::sort(v.begin(), v.end(), loc);
*
```

Parameters

<code>__s1</code>	First string to compare.
<code>__s2</code>	Second string to compare.

Returns

True if `collate<_Char> facet` compares `__s1 < __s2`, else false.

4.808.4.7 `const locale& std::locale::operator= (const locale & __other) throw`

Assignment operator.

Set this locale to be a copy of *other*.

Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

Returns

A reference to this locale.

4.808.4.8 `bool std::locale::operator== (const locale & __other) const throw`

Locale equality.

Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

Returns

True if *other* and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by `operator!=(.)`.

4.808.5 Friends And Related Function Documentation

4.808.5.1 `template<typename _Facet> bool has_facet (const locale &) throw` `[friend]`

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	---

Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

Returns

true if `__loc` contains a facet of type `_Facet`, else false.

Definition at line 104 of file `locale_classes.tcc`.

4.808.5.2 `template<typename _Facet > const _Facet& use_facet (const locale &) [friend]`

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

Returns

Reference to facet of type `Facet`.

Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	---

Definition at line 132 of file `locale_classes.tcc`.

4.808.6 Member Data Documentation

4.808.6.1 `const category std::locale::all [static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 105 of file `locale_classes.h`.

4.808.6.2 `const category std::locale::collate [static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 101 of file `locale_classes.h`.

4.808.6.3 `const category std::locale::ctype` `[static]`

Category values.

The standard category values are `none`, `ctype`, `numeric`, `collate`, `time`, `monetary`, and `messages`. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 99 of file `locale_classes.h`.

4.808.6.4 `const category std::locale::messages` `[static]`

Category values.

The standard category values are `none`, `ctype`, `numeric`, `collate`, `time`, `monetary`, and `messages`. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 104 of file `locale_classes.h`.

4.808.6.5 `const category std::locale::monetary` `[static]`

Category values.

The standard category values are `none`, `ctype`, `numeric`, `collate`, `time`, `monetary`, and `messages`. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 103 of file `locale_classes.h`.

4.808.6.6 `const category std::locale::none` `[static]`

Category values.

The standard category values are `none`, `ctype`, `numeric`, `collate`, `time`, `monetary`, and `messages`. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 98 of file `locale_classes.h`.

4.808.6.7 `const category std::locale::numeric` `[static]`

Category values.

The standard category values are `none`, `ctype`, `numeric`, `collate`, `time`, `monetary`, and `messages`. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 100 of file `locale_classes.h`.

4.808.6.8 `const category std::locale::time` `[static]`

Category values.

The standard category values are `none`, `ctype`, `numeric`, `collate`, `time`, `monetary`, and `messages`. They form a bitmask that supports union and intersection. The category `all` is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

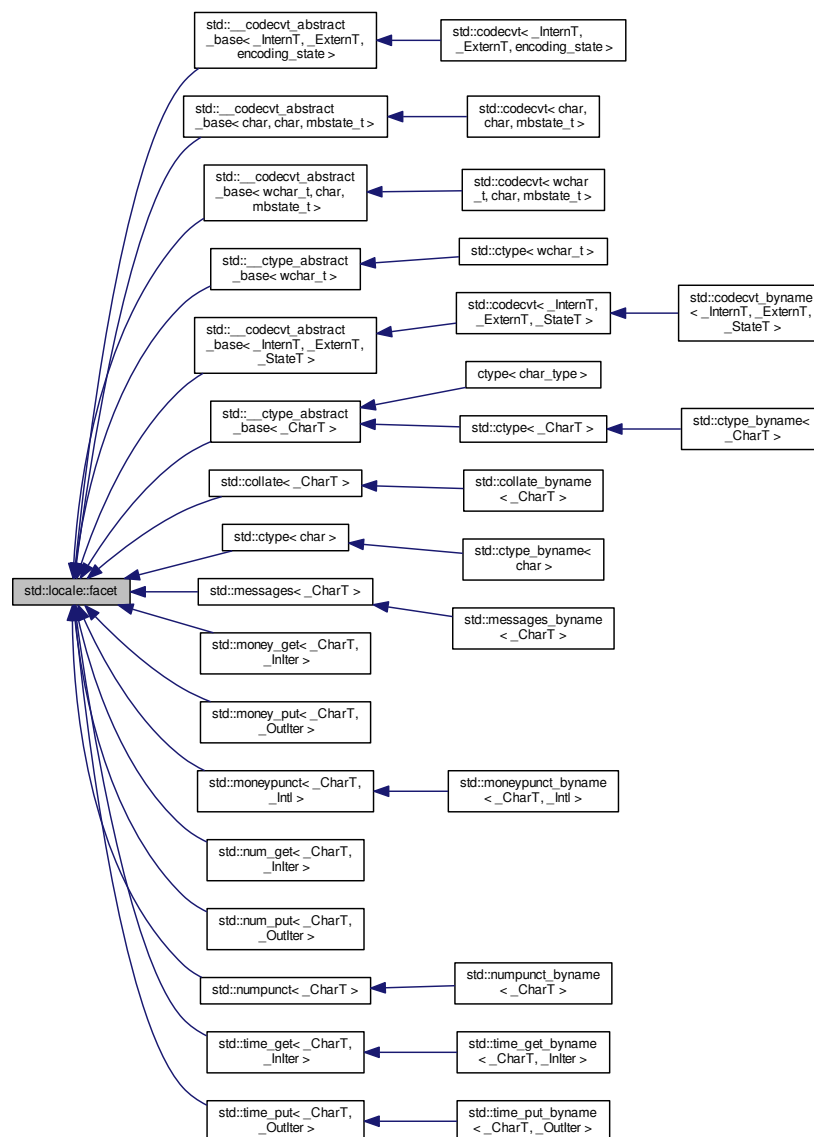

Definition at line 102 of file `locale_classes.h`.

- class **locale::_Impl**

4.809.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

Definition at line 338 of file locale_classes.h.

4.809.2 Constructor & Destructor Documentation

4.809.2.1 std::locale::facet::facet (size_t __refs = 0) throw () [inline], [explicit], [protected]

Facet constructor.

This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

Parameters

<code>__refs</code>	The initial value for reference count.
---------------------	--

Definition at line 370 of file locale_classes.h.

4.809.2.2 virtual std::locale::facet::~facet () [protected], [virtual]

Facet destructor.

The documentation for this class was generated from the following file:

- [locale_classes.h](#)

4.810 std::locale::id Class Reference

Public Member Functions

- [id](#) ()
- [size_t _M_id](#) () const throw ()

- class **locale**
- class **locale::_Impl**
- [template<typename _Facet > const _Facet & use_facet](#) (const [locale](#) &)

4.810.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

Definition at line 436 of file `locale_classes.h`.

4.810.2 Constructor & Destructor Documentation

4.810.2.1 `std::locale::id::id () [inline]`

Constructor.

Definition at line 467 of file `locale_classes.h`.

4.810.3 Friends And Related Function Documentation

4.810.3.1 `template<typename _Facet > bool has_facet (const locale &) throw) [friend]`

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	---

Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

Returns

true if `__loc` contains a facet of type `_Facet`, else false.

Definition at line 104 of file `locale_classes.tcc`.

4.810.3.2 `template<typename _Facet> const _Facet& use_facet (const locale &) [friend]`

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

Returns

Reference to facet of type `Facet`.

Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	---

Definition at line 132 of file `locale_classes.tcc`.

4.812 std::logic_error Class Reference

Inheritance diagram for std::logic_error:

Public Member Functions

- [logic_error](#) (const [string](#) &__arg)
- virtual const char * [what](#) () const noexcept

4.812.1 Detailed Description

One of two subclasses of exception.

Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

Definition at line 55 of file `stdexcept`.

4.812.2 Constructor & Destructor Documentation

4.812.2.1 std::logic_error::logic_error (const [string](#) &__arg) [explicit]

Takes a character string describing the error.

4.812.3 Member Function Documentation

4.812.3.1 virtual const char* std::logic_error::what () const [virtual], [noexcept]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this class was generated from the following file:

4.816.1 Detailed Description

template<typename _RealType = double>class std::lognormal_distribution<_RealType>

A lognormal_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m,s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Definition at line 2298 of file random.h.

4.816.2 Member Typedef Documentation

4.816.2.1 template<typename _RealType = double> typedef _RealType std::lognormal_distribution<_RealType>::result_type

The type of the range of the distribution.

Definition at line 2301 of file random.h.

4.816.3 Member Function Documentation

4.816.3.1 template<typename _RealType = double> result_type std::lognormal_distribution<_RealType>::max ()
const [inline]

Returns the least upper bound value of the distribution.

Definition at line 2389 of file random.h.

References std::numeric_limits<_Tp>::max().

4.816.3.2 `template<typename _RealType = double> result_type std::lognormal_distribution<_RealType>::min () const`
`[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2382 of file random.h.

4.816.3.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type`
`std::lognormal_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng)`
`[inline]`

Generating functions.

Definition at line 2397 of file random.h.

4.816.3.4 `template<typename _RealType = double> param_type std::lognormal_distribution<_RealType>::param ()`
`const [inline]`

Returns the parameter set of the distribution.

Definition at line 2367 of file random.h.

4.816.3.5 `template<typename _RealType = double> void std::lognormal_distribution<_RealType>::param (const`
`param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2375 of file random.h.

4.816.3.6 `template<typename _RealType = double> void std::lognormal_distribution<_RealType>::reset ()`
`[inline]`

Resets the distribution state.

Definition at line 2349 of file random.h.

References `std::normal_distribution<_RealType>::reset()`.

4.816.4 Friends And Related Function Documentation

4.816.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits >`
`std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::lognormal_distribution<_RealType1> & __x) [friend]`

Inserts a `lognormal_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>lognormal_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.816.4.2 `template<typename _RealType = double> bool operator==(const lognormal_distribution<_RealType> &__d1, const lognormal_distribution<_RealType> &__d2) [friend]`

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2434 of file random.h.

4.816.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> &__is, std::lognormal_distribution<_RealType1> &__x) [friend]`

Extracts a lognormal_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A lognormal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.818.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> class std::map< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<pair<const _Key, _Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 96 of file `stl_map.h`.

4.818.2 Constructor & Destructor Documentation

4.818.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map () [inline]`

Default constructor creates no elements.

Definition at line 162 of file `stl_map.h`.

4.818.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::map< _Key, _Tp, _Compare, _Alloc >::map (const _Compare & __comp, const allocator_type & __a = allocator_type()) [inline], [explicit]`

Creates a map with no elements.

Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Definition at line 171 of file `stl_map.h`.

```
4.818.2.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >> std::map<_Key, _Tp, _Compare, _Alloc >::map ( const map<  
_Key, _Tp, _Compare, _Alloc > &__x ) [inline]
```

Map copy constructor.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The newly-created map uses a copy of the allocation object used by `__x`.

Definition at line 182 of file `stl_map.h`.

```
4.818.2.4  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::map<_Key, _Tp, _Compare, _Alloc>::map (
initializer_list< value_type > __l, const _Compare & __comp = _Compare(), const allocator_type & __a =
allocator_type() ) [inline]
```

Builds a map from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements in the `initializer_list` `__l`. This is linear in `N` if the range is already sorted, and `NlogN` otherwise (where `N` is `__l.size()`).

Definition at line 208 of file `stl_map.h`.

```
4.818.2.5  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const
allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 216 of file `stl_map.h`.

```
4.818.2.6  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const map<
_Key, _Tp, _Compare, _Alloc> & __m, const allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

Definition at line 220 of file `stl_map.h`.

```
4.818.2.7  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::map<_Key, _Tp, _Compare, _Alloc>::map ( initializer_list<
value_type > __l, const allocator_type & __a ) [inline]
```

Allocator-extended initializer-list constructor.

Definition at line 230 of file `stl_map.h`.

```
4.818.2.8  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator> std::map<_Key, _Tp, _Compare,
_Alloc>::map ( _InputIterator __first, _InputIterator __last, const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

Definition at line 236 of file `stl_map.h`.

```
4.818.2.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::map<_Key, _Tp, _Compare,  
_Alloc >::map ( _InputIterator __first, _InputIterator __last ) [inline]
```

Builds a map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a map consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and $N\log N$ otherwise (where N is `distance(__first,__last)`).

Definition at line 253 of file `stl_map.h`.

```
4.818.2.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::map<_Key, _Tp,
_Compare, _Alloc>::map ( _InputIterator __first, _InputIterator __last, const _Compare & __comp, const
allocator_type & __a = allocator_type() ) [inline]
```

Builds a map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and $N\log N$ otherwise (where N is `distance(__first,__last)`).

Definition at line 270 of file `stl_map.h`.

4.818.3 Member Function Documentation

```
4.818.3.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::map<_Key, _Tp, _Compare, _Alloc>::at ( const
key_type & __k ) [inline]
```

Access to map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 535 of file `stl_map.h`.

```
4.818.3.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin ( )
[inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 354 of file `stl_map.h`.

```
4.818.3.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 363 of file stl_map.h.

```
4.818.3.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cbegin ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 427 of file stl_map.h.

```
4.818.3.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cend ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 436 of file stl_map.h.

```
4.818.3.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::map<_Key, _Tp, _Compare, _Alloc>::clear ( )
[inline], [noexcept]
```

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 825 of file stl_map.h.

Referenced by std::map< char, _TokenT >::operator=().

```
4.818.3.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map<_Key, _Tp, _Compare, _Alloc>::count ( const
key_type & __x ) const [inline]
```

Finds the number of elements with given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 885 of file stl_map.h.

```
4.818.3.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc>::
>::crbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 445 of file stl_map.h.

```
4.818.3.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc>::
>::crend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 454 of file stl_map.h.

```
4.818.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> std::pair<iterator, bool>
std::map<_Key, _Tp, _Compare, _Alloc>::emplace ( _Args &&... _args ) [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 574 of file stl_map.h.

```
4.818.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator std::map<_Key, _Tp,
_Compare, _Alloc>::emplace_hint ( const_iterator __pos, _Args &&... _args ) [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 604 of file `stl_map.h`.

```
4.818.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::map<_Key, _Tp, _Compare, _Alloc>::empty ( ) const
[inline], [noexcept]
```

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

Definition at line 463 of file `stl_map.h`.

```
4.818.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::end ( )
[inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 372 of file `stl_map.h`.

Referenced by `std::map< char, _TokenT >::at()`, and `std::map< char, _TokenT >::operator[]()`.

```
4.818.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::end ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 381 of file `stl_map.h`.

```
4.818.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::map<_Key, _Tp, _Compare,
_Alloc>::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 954 of file `stl_map.h`.

```
4.818.3.16  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
              std::allocator<std::pair<const _Key, _Tp>>> std::pair<const_iterator, const_iterator> std::map<_Key, _Tp,
              _Compare, _Alloc>::equal_range ( const key_type & __x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 973 of file `stl_map.h`.

```
4.818.3.17  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
              std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::erase (
              const_iterator __position )    [inline]
```

Erases an element from a map.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 724 of file stl_map.h.

```
4.818.3.18 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> size_type std::map<_Key, _Tp, _Compare, _Alloc >::erase ( const
key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 760 of file stl_map.h.

```
4.818.3.19 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::map<_Key, _Tp, _Compare, _Alloc >::erase (
const_iterator __first, const_iterator __last ) [inline]
```

Erases a [first,last) range of elements from a map.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 780 of file stl_map.h.

```
4.818.3.20 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::map<_Key, _Tp, _Compare, _Alloc >::find ( const
key_type & __x ) [inline]
```

Tries to locate an element in a map.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 858 of file `stl_map.h`.

```
4.818.3.21  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x ) const    [inline]
```

Tries to locate an element in a map.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 873 of file `stl_map.h`.

```
4.818.3.22  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::map<_Key, _Tp, _Compare, _Alloc
            >::get_allocator ( ) const    [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 344 of file `stl_map.h`.

```
4.818.3.23  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::map<_Key, _Tp, _Compare, _Alloc
            >::insert ( const value_type & __x )    [inline]
```

Attempts to insert a `std::pair` into the map.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 628 of file stl_map.h.

Referenced by std::map< char, _TokenT >::insert(), std::map< char, _TokenT >::operator=(), and std::map< char, _TokenT >::operator[]().

```
4.818.3.24 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
std::initializer_list< value_type > __list ) [inline]
```

Attempts to insert a list of std::pairs into the map.

Parameters

<code>__list</code>	A std::initializer_list<value_type> of pairs to be inserted.
---------------------	--

Complexity similar to that of the range constructor.

Definition at line 649 of file stl_map.h.

```
4.818.3.25 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator > void std::map< _Key, _Tp,
_Compare, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

Template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 704 of file stl_map.h.

```
4.818.3.26 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> key_compare std::map< _Key, _Tp, _Compare, _Alloc >::key_comp (
) const [inline]
```

Returns the key comparison object out of which the map was constructed.

Definition at line 834 of file stl_map.h.

Referenced by std::map< char, _TokenT >::at(), and std::map< char, _TokenT >::operator[]().

```
4.818.3.27 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 900 of file stl_map.h.

Referenced by `std::map< char, _TokenT >::at()`, and `std::map< char, _TokenT >::operator[]()`.

```
4.818.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 915 of file `stl_map.h`.

```
4.818.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size ( )
const [inline],[noexcept]
```

Returns the maximum size of the map.

Definition at line 473 of file `stl_map.h`.

```
4.818.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map< _Key, _Tp, _Compare, _Alloc >::noexcept (
is_nothrow_copy_constructible< _Compare >::value ) [inline]
```

Map move constructor.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The newly-created map contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified map.

Definition at line 194 of file `stl_map.h`.

```
4.818.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map< _Key, _Tp, _Compare, _Alloc >::noexcept (
is_nothrow_copy_constructible< _Compare >::value && _Alloc_traits:: _S_always_equal() ) [inline]
```

Allocator-extended move constructor.

Definition at line 225 of file `stl_map.h`.

```
4.818.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= ( const
map< _Key, _Tp, _Compare, _Alloc > & __x ) [inline]
```

Map assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 293 of file `stl_map.h`.

```
4.818.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
map<_Key, _Tp, _Compare, _Alloc> && __x ) [inline], [noexcept]
```

Map move assignment operator.

Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this map (without copying). `__x` is a valid, but unspecified map.

Definition at line 308 of file `stl_map.h`.

```
4.818.3.34 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
initializer_list<value_type> __l ) [inline]
```

Map list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 334 of file `stl_map.h`.

```
4.818.3.35 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::map<_Key, _Tp, _Compare, _Alloc>::operator[]
( const key_type & __k ) [inline]
```

Subscript (`[]`) access to map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

Definition at line 490 of file stl_map.h.

```
4.818.3.36 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc
>::rbegin( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 390 of file stl_map.h.

```
4.818.3.37 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc
>::rbegin( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 399 of file stl_map.h.

```
4.818.3.38 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc >::rend (
) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 408 of file stl_map.h.

```
4.818.3.39 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc
>::rend( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 417 of file stl_map.h.

```
4.818.3.40 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map<_Key, _Tp, _Compare, _Alloc >::size ( ) const
[inline], [noexcept]
```

Returns the size of the map.

Definition at line 468 of file stl_map.h.

```
4.818.3.41 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc >::upper_bound (
const key_type &_x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 925 of file stl_map.h.

```
4.818.3.42 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc
>::upper_bound ( const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 935 of file stl_map.h.

```
4.818.3.43 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> value_compare std::map< _Key, _Tp, _Compare, _Alloc
>::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

Definition at line 842 of file stl_map.h.

4.818.4 Member Data Documentation

```
4.818.4.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::map< _Key, _Tp, _Compare, _Alloc >::iterator
```

Attempts to insert a std::pair into the map.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of __x (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 682 of file stl_map.h.

4.818.4.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::void`

Swaps data with another map.

Parameters

<code>__x</code>	A map of the same element and allocator types.
------------------	--

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 816 of file `stl_map.h`.

4.819.1 Detailed Description

`template<class _Tp>class std::mask_array< _Tp >`

Reference to selected subset of an array.

A `mask_array` is a reference to the actual elements of an array specified by a bitmask in the form of an array of `bool`. The way to get a `mask_array` is to call `operator[](valarray<bool>)` on a `valarray`. The returned `mask_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if a `mask_array` is obtained using the array `(false, true, false, true)` as an argument, the mask array has two elements referring to `array[1]` and `array[3]` in the underlying array.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 83 of file `valarray`.

The documentation for this class was generated from the following files:

4.820.1 Detailed Description

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> class std::match_results< _Bi_iter, _Alloc >
```

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched.

Definition at line 1476 of file `regex.h`.

4.820.2 Constructor & Destructor Documentation

```
4.820.2.1 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter,
    _Alloc>::match_results ( const match_results< _Bi_iter, _Alloc > &__rhs ) [inline]
```

Copy constructs a `match_results`.

Definition at line 1530 of file `regex.h`.

Referenced by `std::match_results< _Bi_iter >::operator=()`.

```
4.820.2.2 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter,
    _Alloc>::match_results ( match_results< _Bi_iter, _Alloc > &&__rhs ) [inline], [noexcept]
```

Move constructs a `match_results`.

Definition at line 1537 of file `regex.h`.

```
4.820.2.3 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter,
    _Alloc>::~~match_results ( ) [inline]
```

Destroys a `match_results` object.

Definition at line 1564 of file `regex.h`.

4.820.3 Member Function Documentation

```
4.820.3.1 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> std::match_results< _Bi_iter,
    _Alloc>::M_in_iterator ( false ) [inline], [explicit]
```

Constructs a default `match_results` container.

Postcondition

size() returns 0 and str() returns an empty string.

Definition at line 1524 of file regex.h.

4.820.3.2 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator
std::match_results< _Bi_iter, _Alloc >::begin () const [inline]

Gets an iterator to the start of the sub_match collection.

Definition at line 1726 of file regex.h.

Referenced by std::operator==().

4.820.3.3 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator
std::match_results< _Bi_iter, _Alloc >::cbegin () const [inline]

Gets an iterator to the start of the sub_match collection.

Definition at line 1733 of file regex.h.

4.820.3.4 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator
std::match_results< _Bi_iter, _Alloc >::cend () const [inline]

Gets an iterator to one-past-the-end of the collection.

Definition at line 1747 of file regex.h.

4.820.3.5 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> bool std::match_results<
_Bi_iter, _Alloc >::empty () const [inline]

Indicates if the match_results contains no results.

Return values

<i>true</i>	The match_results object is empty.
<i>false</i>	The match_results object is not empty.

Definition at line 1608 of file regex.h.

Referenced by std::operator==(), std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator==(), std::match_results< _Bi_iter >::prefix(), and std::match_results< _Bi_iter >::suffix().

4.820.3.6 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator
std::match_results< _Bi_iter, _Alloc >::end () const [inline]

Gets an iterator to one-past-the-end of the collection.

Definition at line 1740 of file regex.h.

Referenced by std::operator==().

4.820.3.7 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> template<typename _Out_iter >
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (_Out_iter __out, const char_type * __fmt_first, const
char_type * __fmt_last, match_flag_type __flags = regex_constants::format_default) const

Precondition

ready() == true

Referenced by std::match_results< _Bi_iter >::format().

4.820.3.8 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> template<typename _Out_iter, typename _St, typename _Sa > _Out_iter std::match_results<_Bi_iter, _Alloc>::format (_Out_iter __out, const basic_string< char_type, _St, _Sa > & __fmt, match_flag_type __flags = regex_constants::format_default) const [inline]`

Precondition

`ready() == true`

Definition at line 1776 of file regex.h.

4.820.3.9 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> template<typename _Out_iter, typename _St, typename _Sa > basic_string<char_type, _St, _Sa> std::match_results<_Bi_iter, _Alloc>::format (const basic_string< char_type, _St, _Sa > & __fmt, match_flag_type __flags = regex_constants::format_default) const [inline]`

Precondition

`ready() == true`

Definition at line 1788 of file regex.h.

4.820.3.10 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> string_type std::match_results<_Bi_iter, _Alloc>::format (const char_type * __fmt, match_flag_type __flags = regex_constants::format_default) const [inline]`

Precondition

`ready() == true`

Definition at line 1800 of file regex.h.

4.820.3.11 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> allocator_type std::match_results<_Bi_iter, _Alloc>::get_allocator () const [inline]`

Gets a copy of the allocator.

Definition at line 1822 of file regex.h.

4.820.3.12 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> difference_type std::match_results<_Bi_iter, _Alloc>::length (size_type __sub = 0) const [inline]`

Gets the length of the indicated submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

Definition at line 1627 of file regex.h.

4.820.3.13 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> size_type std::match_results<_Bi_iter, _Alloc>::max_size () const [inline]`

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1599 of file regex.h.

```
4.820.3.14 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results&
std::match_results<_Bi_iter, _Alloc >::operator= ( const match_results<_Bi_iter, _Alloc > & __rhs )
[inline]
```

Assigns rhs to *this.

Definition at line 1545 of file regex.h.

```
4.820.3.15 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results&
std::match_results<_Bi_iter, _Alloc >::operator= ( match_results<_Bi_iter, _Alloc > && __rhs )
[inline]
```

Move-assigns rhs to *this.

Definition at line 1555 of file regex.h.

```
4.820.3.16 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference
std::match_results<_Bi_iter, _Alloc >::operator[] ( size_type __sub ) const [inline]
```

Gets a sub_match reference for the match or submatch.

Parameters

__sub	indicates the submatch.
-------	-------------------------

Precondition

ready() == true

This function gets a reference to the indicated submatch, or the entire match if __sub is zero.

If __sub >= size() then this function returns a sub_match with a special value indicating no submatch.

Definition at line 1680 of file regex.h.

```
4.820.3.17 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type
std::match_results<_Bi_iter, _Alloc >::position ( size_type __sub = 0 ) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

Parameters

__sub	indicates the submatch.
-------	-------------------------

Precondition

ready() == true

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of __sub is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

Returns -1 if `__sub` is out of range.

Definition at line 1644 of file `regex.h`.

4.820.3.18 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_reference
std::match_results<_Bi_iter, _Alloc>::prefix () const [inline]`

Gets a `sub_match` representing the match prefix.

Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

Definition at line 1697 of file `regex.h`.

Referenced by `std::operator==()`, and `std::match_results<_Bi_iter>::position()`.

4.820.3.19 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> bool std::match_results<
_Bi_iter, _Alloc>::ready () const [inline]`

Indicates if the `match_results` is ready.

Return values

<i>true</i>	The object has a fully-established result state.
<i>false</i>	The object is not ready.

Definition at line 1575 of file `regex.h`.

Referenced by `std::operator==()`, `std::match_results<_Bi_iter>::operator[]()`, `std::match_results<_Bi_iter>::prefix()`, and `std::match_results<_Bi_iter>::suffix()`.

4.820.3.20 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> size_type
std::match_results<_Bi_iter, _Alloc>::size () const [inline]`

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1592 of file `regex.h`.

Referenced by `std::match_results<_Bi_iter>::empty()`, `std::operator==()`, `std::match_results<_Bi_iter>::operator[]()`, and `std::match_results<_Bi_iter>::position()`.

4.820.3.21 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> string_type
std::match_results<_Bi_iter, _Alloc>::str (size_type __sub = 0) const [inline]`

Gets the match or submatch converted to a string type.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

Definition at line 1665 of file `regex.h`.

4.820.3.22 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_reference
std::match_results<_Bi_iter, _Alloc>::suffix () const [inline]`

Gets a `sub_match` representing the match suffix.

Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the end of the match and the end of the target range.

Definition at line 1714 of file `regex.h`.

Referenced by `std::operator==()`.

4.820.3.23 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> void std::match_results<
_Bi_iter, _Alloc>::swap (match_results<_Bi_iter, _Alloc> &__that) [inline]`

Swaps the contents of two `match_results`.

Definition at line 1836 of file `regex.h`.

Referenced by `std::swap()`.

4.820.4 Member Data Documentation

4.820.4.1 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter,
_Alloc>::__pad0__ [explicit]`

Constructs a default `match_results` container.

Postcondition

`size()` returns 0 and `str()` returns an empty string.

Definition at line 1524 of file `regex.h`.

4.825.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s,
        _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>class std::mersenne_twister_engine< _UIntType, __w, __n, __m,
        __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined `mt19937` class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

Template Parameters

<code>__w</code>	Word size, the number of bits in each element of the state vector.
<code>__n</code>	The degree of recursion.
<code>__m</code>	The period parameter.
<code>__r</code>	The separation point bit index.
<code>__a</code>	The last row of the twist matrix.
<code>__u</code>	The first right-shift tempering matrix parameter.
<code>__d</code>	The first right-shift tempering matrix mask.
<code>__s</code>	The first left-shift tempering matrix parameter.
<code>__b</code>	The first left-shift tempering matrix mask.
<code>__t</code>	The second left-shift tempering matrix parameter.
<code>__c</code>	The second left-shift tempering matrix mask.
<code>__l</code>	The second right-shift tempering matrix parameter.
<code>__f</code>	Initialization multiplier.

Definition at line 449 of file random.h.

4.825.2 Member Typedef Documentation

4.825.2.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::result_type`

The type of the generated random value.

Definition at line 452 of file random.h.

4.825.3 Constructor & Destructor Documentation

4.825.3.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _Sseq, typename = typename std::enable_if<!std::is_same<_Sseq, mersenne_twister_engine>::value>::type> std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::mersenne_twister_engine (_Sseq & __q) [inline], [explicit]`

Constructs a mersenne_twister_engine random number generator engine seeded from the seed sequence `__q`.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

Definition at line 513 of file random.h.

4.825.4 Member Function Documentation

4.825.4.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::discard (unsigned long long __z)`

Discard a sequence of random numbers.

Definition at line 435 of file bits/random.tcc.

4.825.4.2 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::max () [inline], [static]`

Gets the largest possible value in the output range.

Definition at line 534 of file random.h.

4.825.4.3 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min () [inline], [static]`

Gets the smallest possible value in the output range.

Definition at line 527 of file random.h.

4.825.5 Friends And Related Function Documentation

4.825.5.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x) [friend]`

Inserts the current state of a % mersenne_twister_engine random number generator engine __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

4.825.5.2 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> bool operator== (const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs, const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs) [friend]`

Compares two % mersenne_twister_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A % mersenne_twister_engine random number generator object.
<code>__rhs</code>	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 559 of file random.h.

4.825.5.3 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::mersenne_twister_engine<_UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1> & __x) [friend]`

Extracts the current state of a % mersenne_twister_engine random number generator engine __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

Returns

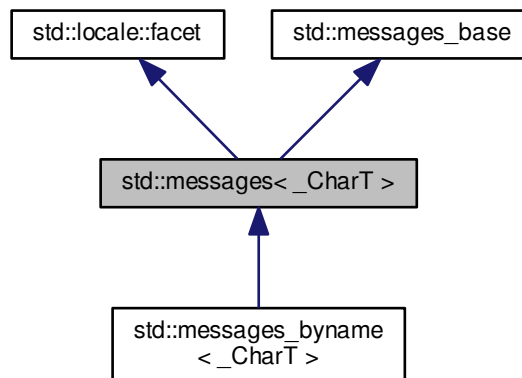

The input stream with the state of __x extracted or in an error state.

4.826.1 Detailed Description

```
template<typename _CharT>class std::messages< _CharT >
```

Primary class template messages.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

Definition at line 1695 of file locale_facets_nonio.h.

4.826.2 Member Typedef Documentation

4.826.2.1 `template<typename _CharT > typedef _CharT std::messages< _CharT >::char_type`

Public typedefs.

4.826.3 Constructor & Destructor Documentation

4.826.3.1 `template<typename _CharT > std::messages< _CharT >::messages (size_t __refs = 0) [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 44 of file messages_members.h.

4.826.3.2 `template<typename _CharT > std::messages< _CharT >::messages (__c_locale __cloc, const char * __s, size_t __refs = 0) [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	RefCount to pass to the base class.

Definition at line 50 of file `messages_members.h`.

4.826.3.3 `template<typename _CharT> std::messages<_CharT>::~messages()` `[protected]`, `[virtual]`

Destructor.

Definition at line 79 of file `messages_members.h`.

4.832.3 Constructor & Destructor Documentation

4.832.3.1 `template<typename _CharT, typename _InIter> std::money_get< _CharT, _InIter >::money_get (size_t __refs = 0) [inline],[explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1392 of file locale_facets_nonio.h.

4.832.3.2 `template<typename _CharT, typename _InIter> virtual std::money_get< _CharT, _InIter >::~~money_get () [inline],[protected],[virtual]`

Destructor.

Definition at line 1460 of file locale_facets_nonio.h.

4.832.4 Member Function Documentation

4.832.4.1 `template<typename _CharT, typename _InIter> _InIter std::money_get< _CharT, _InIter >::do_get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units) const [protected],[virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See Also

`get()` for details.

Definition at line 365 of file locale_facets_nonio.tcc.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`.

Referenced by `std::money_get< _CharT, _InIter >::get()`.

4.832.4.2 `template<typename _CharT, typename _InIter > _InIter std::money_get< _CharT, _InIter >::do_get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, string_type & __digits) const [protected], [virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See Also

`get()` for details.

Definition at line 378 of file `locale_facets_nonio.tcc`.

References `std::ios_base::M_getloc()`, `std::basic_string< _CharT, _Traits, _Alloc >::resize()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

4.832.4.3 `template<typename _CharT, typename _InIter > iter_type std::money_get< _CharT, _InIter >::get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units) const [inline]`

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `moneypunct::frac_digits()` * the actual amount. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>facet<moneypunct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1422 of file `locale_facets_nonio.h`.

References `std::money_get< _CharT, _InIter >::do_get()`.

4.832.4.4 `template<typename _CharT, typename _InIter > iter_type std::money_get< _CharT, _InIter >::get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, string_type & __digits) const [inline]`

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `digits`. For example, the string \$10.01 in a US locale would store 1001 in `digits`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1453 of file `locale_facets_nonio.h`.

References `std::money_get< _CharT, _InIter >::do_get()`.

4.833.1 Detailed Description

`template<typename _CharT, typename _Outlter>class std::money_put<_CharT, _Outlter>`

Primary class template `money_put`.

This facet encapsulates the code to format and output a monetary amount.

The `money_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_put` facet.

Definition at line 1521 of file `locale_facets_nonio.h`.

4.833.2 Member Typedef Documentation

4.833.2.1 template<typename _CharT, typename _Outiter> typedef _CharT std::money_put<_CharT, _Outiter>::char_type

Public typedefs.

Definition at line 1526 of file locale_facets_nonio.h.

4.833.2.2 template<typename _CharT, typename _Outiter> typedef _Outiter std::money_put<_CharT, _Outiter>::iter_type

Public typedefs.

Definition at line 1527 of file locale_facets_nonio.h.

4.833.2.3 template<typename _CharT, typename _Outiter> typedef basic_string<_CharT> std::money_put<_CharT, _Outiter>::string_type

Public typedefs.

Definition at line 1528 of file locale_facets_nonio.h.

4.833.3 Constructor & Destructor Documentation

4.833.3.1 template<typename _CharT, typename _Outiter> std::money_put<_CharT, _Outiter>::money_put (size_t __refs = 0) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1542 of file locale_facets_nonio.h.

4.833.3.2 template<typename _CharT, typename _Outiter> virtual std::money_put<_CharT, _Outiter>::~~money_put () [inline], [protected], [virtual]

Destructor.

Definition at line 1592 of file locale_facets_nonio.h.

4.833.4 Member Function Documentation

4.833.4.1 template<typename _CharT, typename _Outiter> _Outiter std::money_put<_CharT, _Outiter>::do_put (iter_type __s, bool __intl, ios_base & __io, char_type __fill, long double __units) const [protected], [virtual]

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the value 1001 in a US locale would write \$10.01 to *__s*.

This function is a hook for derived classes to change the value returned.

See Also

put().

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 570 of file `locale_facets_nonio.tcc`.

References `std::ios_base::getloc()`, and `std::__ctype_abstract_base<_CharT >::widen()`.

Referenced by `std::money_put<_CharT, _Outlter >::put()`.

```
4.833.4.2 template<typename _CharT, typename _Outlter > _Outlter std::money_put<_CharT, _Outlter >::do_put ( iter_type
    __s, bool __intl, ios_base & __io, char_type __fill, const string_type & __digits ) const [protected],
    [virtual]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function is a hook for derived classes to change the value returned.

See Also

`put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 608 of file `locale_facets_nonio.tcc`.

```
4.833.4.3 template<typename _CharT, typename _Outlter > iter_type std::money_put<_CharT, _Outlter >::put ( iter_type
    __s, bool __intl, ios_base & __io, char_type __fill, long double __units ) const [inline]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value `1001` in a US locale would write `$10.01` to `__s`.

This function works by returning the result of `do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1562 of file `locale_facets_nonio.h`.

References `std::money_put< _CharT, _Outlter >::do_put()`.

4.833.4.4 `template<typename _CharT, typename _Outlter> iter_type std::money_put< _CharT, _Outlter >::put (iter_type __s, bool __intl, ios_base & __io, char_type __fill, const string_type & __digits) const [inline]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function works by returning the result of `do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1585 of file `locale_facets_nonio.h`.

References `std::money_put< _CharT, _Outlter >::do_put()`.

4.834.1 Detailed Description

template<typename _CharT, bool _Intl>class std::moneypunct<_CharT, _Intl>

Primary class template moneypunct.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

Definition at line 934 of file locale_facets_nonio.h.

4.834.2 Member Typedef Documentation

4.834.2.1 `template<typename _CharT, bool _Intl> typedef _CharT std::moneypunct<_CharT, _Intl>::char_type`

Public typedefs.

Definition at line 940 of file locale_facets_nonio.h.

4.834.2.2 `template<typename _CharT, bool _Intl> typedef basic_string<_CharT> std::moneypunct<_CharT, _Intl>::string_type`

Public typedefs.

Definition at line 941 of file locale_facets_nonio.h.

4.834.3 Constructor & Destructor Documentation

4.834.3.1 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct (size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 963 of file locale_facets_nonio.h.

4.834.3.2 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct (__cache_type * __cache, size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is an internal constructor.

Parameters

<code>__cache</code>	Cache for optimization.
<code>__refs</code>	Passed to the base facet class.

Definition at line 976 of file locale_facets_nonio.h.

4.834.3.3 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct (__c_locale __cloc, const char * __s, size_t __refs = 0) [inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Passed to the base facet class.

Definition at line 991 of file locale_facets_nonio.h.

4.834.3.4 `template<typename _CharT, bool _Intl> virtual std::moneypunct<_CharT, _Intl>::~~moneypunct ()`
`[protected], [virtual]`

Destructor.

4.834.4 Member Function Documentation

4.834.4.1 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::curr_symbol () const`
`[inline]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning `returning moneypunct<char_type>::do_curr_symbol()`.

Returns

string_type representing a currency symbol.

Definition at line 1061 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_curr_symbol()`.

4.834.4.2 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::decimal_point () const`
`[inline]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning moneypunct<char_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1005 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_decimal_point()`.

4.834.4.3 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_curr_symbol () const`
`[inline], [protected], [virtual]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See Also

`curr_symbol()` for details.

Returns

string_type representing a currency symbol.

Definition at line 1207 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::curr_symbol()`.

4.834.4.4 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_decimal_point () const` `[inline], [protected], [virtual]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1169 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::decimal_point()`.

4.834.4.5 `template<typename _CharT, bool _Intl> virtual int std::moneypunct<_CharT, _Intl>::do_frac_digits () const` `[inline], [protected], [virtual]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See Also

`frac_digits()` for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::frac_digits()`.

4.834.4.6 `template<typename _CharT, bool _Intl> virtual string std::moneypunct<_CharT, _Intl>::do_grouping () const` `[inline], [protected], [virtual]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See Also

`grouping()` for details.

Returns

String representing grouping specification.

Definition at line 1194 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::grouping()`.

4.834.4.7 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_neg_format () const` `[inline], [protected], [virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See Also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1275 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::neg_format().

4.834.4.8 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign () const [inline],[protected],[virtual]`

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See Also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1233 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::negative_sign().

4.834.4.9 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format () const [inline],[protected],[virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See Also

pos_format() for details.

Returns

Pattern for money values.

Definition at line 1261 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::pos_format().

4.834.4.10 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign () const [inline],[protected],[virtual]`

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See Also

`positive_sign()` for details.

Returns

string_type representing a positive sign.

Definition at line 1220 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl >::positive_sign()`.

4.834.4.11 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl >::do_thousands_sep () const [inline], [protected], [virtual]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1181 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl >::thousands_sep()`.

4.834.4.12 `template<typename _CharT, bool _Intl> int std::moneypunct<_CharT, _Intl >::frac_digits () const [inline]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

Returns

Number of digits in amount fraction.

Definition at line 1111 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl >::do_frac_digits()`.

4.834.4.13 `template<typename _CharT, bool _Intl> string std::moneypunct<_CharT, _Intl >::grouping () const [inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1048 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_grouping()`.

4.834.4.14 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format () const`
`[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1151 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_neg_format()`.

4.834.4.15 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::negative_sign () const`
`[inline]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1095 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_negative_sign()`.

4.834.4.16 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::pos_format () const`
`[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `money_punct<char_type>::do_pos_format()` or `money_punct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1147 of file `locale_facets_nonio.h`.

References `std::money_punct<_CharT, _Intl>::do_pos_format()`.

4.834.4.17 `template<typename _CharT, bool _Intl> string_type std::money_punct<_CharT, _Intl>::positive_sign () const`
`[inline]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `money_punct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1078 of file `locale_facets_nonio.h`.

References `std::money_punct<_CharT, _Intl>::do_positive_sign()`.

4.834.4.18 `template<typename _CharT, bool _Intl> char_type std::money_punct<_CharT, _Intl>::thousands_sep () const`
`[inline]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `money_punct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1018 of file `locale_facets_nonio.h`.

References `std::money_punct<_CharT, _Intl>::do_thousands_sep()`.

4.835.1 Detailed Description

```
template<typename _CharT, bool _Intl>class std::moneypunct_byname<_CharT, _Intl>
```

class moneypunct_byname [22.2.6.4].

Definition at line 1324 of file locale_facets_nonio.h.

4.835.2 Member Function Documentation

4.835.2.1 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::curr_symbol () const`
`[inline], [inherited]`

Return currency symbol string.

This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

Definition at line 1061 of file locale_facets_nonio.h.

References std::moneypunct<_CharT, _Intl>::do_curr_symbol().

4.835.2.2 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::decimal_point () const`
`[inline], [inherited]`

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_type>::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1005 of file locale_facets_nonio.h.

References std::moneypunct<_CharT, _Intl>::do_decimal_point().

4.835.2.3 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_curr_symbol () const`
`[inline], [protected], [virtual], [inherited]`

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See Also

`curr_symbol()` for details.

Returns

string_type representing a currency symbol.

Definition at line 1207 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::curr_symbol()`.

4.835.2.4 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_decimal_point () const [inline], [protected], [virtual], [inherited]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1169 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::decimal_point()`.

4.835.2.5 `template<typename _CharT, bool _Intl> virtual int std::moneypunct<_CharT, _Intl>::do_frac_digits () const [inline], [protected], [virtual], [inherited]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See Also

`frac_digits()` for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::frac_digits()`.

4.835.2.6 `template<typename _CharT, bool _Intl> virtual string std::moneypunct<_CharT, _Intl>::do_grouping () const [inline], [protected], [virtual], [inherited]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See Also

`grouping()` for details.

Returns

String representing grouping specification.

Definition at line 1194 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::grouping().

4.835.2.7 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_neg_format () const`
`[inline], [protected], [virtual], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See Also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1275 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::neg_format().

4.835.2.8 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_negative_sign () const`
`[inline], [protected], [virtual], [inherited]`

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See Also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1233 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::negative_sign().

4.835.2.9 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_pos_format () const`
`[inline], [protected], [virtual], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See Also

pos_format() for details.

Returns

Pattern for money values.

Definition at line 1261 of file locale_facets_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::pos_format()`.

4.835.2.10 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_positive_sign () const [inline], [protected], [virtual], [inherited]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See Also

`positive_sign()` for details.

Returns

string_type representing a positive sign.

Definition at line 1220 of file locale_facets_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::positive_sign()`.

4.835.2.11 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_thousands_sep () const [inline], [protected], [virtual], [inherited]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1181 of file locale_facets_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::thousands_sep()`.

4.835.2.12 `template<typename _CharT, bool _Intl> int std::moneypunct<_CharT, _Intl>::frac_digits () const [inline], [inherited]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `returning moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

Returns

Number of digits in amount fraction.

Definition at line 1111 of file locale_facets_nonio.h.

References `std::moneypunct<_CharT, _Intl>::do_frac_digits()`.

4.835.2.13 `template<typename _CharT, bool _Intl> string std::moneypunct<_CharT, _Intl >::grouping () const`
`[inline], [inherited]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1048 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl >::do_grouping()`.

4.835.2.14 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl >::neg_format () const`
`[inline], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1151 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl >::do_neg_format()`.

4.835.2.15 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl >::negative_sign () const`
`[inline], [inherited]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1095 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_negative_sign()`.

4.835.2.16 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::pos_format () const`
`[inline], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1147 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_pos_format()`.

4.835.2.17 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::positive_sign () const`
`[inline], [inherited]`

Return positive sign string.

This function returns a *string_type* to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1078 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_positive_sign()`.

4.835.2.18 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::thousands_sep () const`
`[inline], [inherited]`

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning moneypunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1018 of file locale_facets_nonio.h.

References std::moneypunct<_CharT, _Intl>::do_thousands_sep().

4.835.3 Member Data Documentation

4.835.3.1 template<typename _CharT, bool _Intl> locale::id std::moneypunct<_CharT, _Intl>::id [static],
[inherited]

Numpunct facet id.

Definition at line 953 of file locale_facets_nonio.h.

4.836.1 Detailed Description

```
template<typename _Iterator>class std::move_iterator< _Iterator >
```

Class template move_iterator is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

Definition at line 403 of file cpp_type_traits.h.

4.837.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> class std::multimap<_Key, _Tp, _Compare, _Alloc>

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>>.

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 95 of file `stl_multimap.h`.

4.837.2 Constructor & Destructor Documentation

4.837.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ()`
`[inline]`

Default constructor creates no elements.

Definition at line 159 of file `stl_multimap.h`.

4.837.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (const _Compare & __comp, const allocator_type & __a = allocator_type())` `[inline]`, `[explicit]`

Creates a multimap with no elements.

Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Definition at line 168 of file `stl_multimap.h`.

4.837.2.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (const multimap<_Key, _Tp, _Compare, _Alloc> & __x)` `[inline]`

Multimap copy constructor.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The newly-created multimap uses a copy of the allocation object used by `__x`.

Definition at line 179 of file `stl_multimap.h`.

4.837.2.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (initializer_list<value_type> __l, const _Compare & __comp = _Compare(), const allocator_type & __a = allocator_type())` `[inline]`

Builds a multimap from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from the `initializer_list`. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 204 of file `stl_multimap.h`.

4.837.2.5 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (const allocator_type & __a)` `[inline]`, `[explicit]`

Allocator-extended default constructor.

Definition at line 212 of file `stl_multimap.h`.

4.837.2.6 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (const multimap<_Key, _Tp, _Compare, _Alloc> & __m, const allocator_type & __a) [inline]`

Allocator-extended copy constructor.

Definition at line 216 of file `stl_multimap.h`.

4.837.2.7 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (initializer_list<value_type> __l, const allocator_type & __a) [inline]`

Allocator-extended initializer-list constructor.

Definition at line 226 of file `stl_multimap.h`.

4.837.2.8 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (_InputIterator __first, _InputIterator __last, const allocator_type & __a) [inline]`

Allocator-extended range constructor.

Definition at line 232 of file `stl_multimap.h`.

4.837.2.9 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (_InputIterator __first, _InputIterator __last) [inline]`

Builds a multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multimap consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first,__last`)).

Definition at line 248 of file `stl_multimap.h`.

4.837.2.10 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap (_InputIterator __first, _InputIterator __last, const _Compare & __comp, const allocator_type & __a = allocator_type()) [inline]`

Builds a multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first,__last`)).

Definition at line 264 of file `stl_multimap.h`.

4.837.3 Member Function Documentation

4.837.3.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin ()`
`[inline], [noexcept]`

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 348 of file `stl_multimap.h`.

4.837.3.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin () const`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 357 of file `stl_multimap.h`.

4.837.3.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cbegin () const`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 421 of file `stl_multimap.h`.

4.837.3.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cend () const`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 430 of file `stl_multimap.h`.

4.837.3.5 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::multimap<_Key, _Tp, _Compare, _Alloc>::clear ()`
`[inline], [noexcept]`

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 734 of file `stl_multimap.h`.

Referenced by `std::multimap<_Key, _Tp, _Compare, _Alloc>::operator=()`.

4.837.3.6 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::count (const key_type & __x) const`
`[inline]`

Finds the number of elements with given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Number of elements with specified key.

Definition at line 791 of file `stl_multimap.h`.

```
4.837.3.7  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap<_Key, _Tp, _Compare,
_Alloc>::crbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 439 of file `stl_multimap.h`.

```
4.837.3.8  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap<_Key, _Tp, _Compare,
_Alloc>::crend ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 448 of file `stl_multimap.h`.

```
4.837.3.9  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap<_Key, _Tp,
_Compare, _Alloc>::emplace ( _Args &&... __args )    [inline]
```

Build and insert a `std::pair` into the multimap.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 488 of file `stl_multimap.h`.

```
4.837.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap<_Key, _Tp,
_Compare, _Alloc>::emplace_hint ( const_iterator __pos, _Args &&... __args )    [inline]
```

Builds and inserts a `std::pair` into the multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 515 of file `stl_multimap.h`.

```
4.837.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::multimap< _Key, _Tp, _Compare, _Alloc >::empty ( )
const [inline],[noexcept]
```

Returns true if the multimap is empty.

Definition at line 455 of file `stl_multimap.h`.

```
4.837.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end ( )
[inline],[noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 366 of file `stl_multimap.h`.

```
4.837.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end (
) const [inline],[noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 375 of file `stl_multimap.h`.

```
4.837.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::multimap< _Key, _Tp, _Compare,
_Alloc >::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

Definition at line 858 of file `stl_multimap.h`.

```
4.837.3.15  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
              std::allocator<std::pair<const _Key, _Tp>>> std::pair<const_iterator, const_iterator> std::multimap< _Key,
              _Tp, _Compare, _Alloc >::equal_range ( const key_type & __x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

Definition at line 875 of file `stl_multimap.h`.

```
4.837.3.16  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
              std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
              const_iterator __position )    [inline]
```

Erases an element from a multimap.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 629 of file `stl_multimap.h`.

```
4.837.3.17 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::erase (  
const key_type &__x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 665 of file `stl_multimap.h`.

```
4.837.3.18  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __first, const_iterator __last ) [inline]
```

Erases a `[first,last)` range of elements from a multimap.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased .

Returns

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 686 of file `stl_multimap.h`.

```
4.837.3.19  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::find ( const
            key_type & __x ) [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 767 of file `stl_multimap.h`.

```
4.837.3.20  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x ) const [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 782 of file `stl_multimap.h`.

```
4.837.3.21 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::multimap<_Key, _Tp, _Compare, _Alloc
>::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 338 of file `stl_multimap.h`.

```
4.837.3.22 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::insert (
const value_type & __x ) [inline]
```

Inserts a `std::pair` into the multimap.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 535 of file `stl_multimap.h`.

Referenced by `std::multimap<_Key, _Tp, _Compare, _Alloc >::insert()`, and `std::multimap<_Key, _Tp, _Compare, _Alloc >::operator=()`.

```
4.837.3.23 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator > void std::multimap<_Key,
_Tp, _Compare, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 596 of file `stl_multimap.h`.

```
4.837.3.24  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
            std::allocator<std::pair<const _Key, _Tp>>> void std::multimap<_Key, _Tp, _Compare, _Alloc>::insert (  
            initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of `std::pairs` into the `multimap`.

Parameters

__l	A std::initializer_list<value_type> of pairs to be inserted.
-----	--

Complexity similar to that of the range constructor.

Definition at line 608 of file stl_multimap.h.

References std::multimap<_Key, _Tp, _Compare, _Alloc>::insert().

```
4.837.3.25 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> key_compare std::multimap<_Key, _Tp, _Compare, _Alloc>
>::key_comp ( ) const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

Definition at line 743 of file stl_multimap.h.

```
4.837.3.26 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>
>::lower_bound ( const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.
-----	---

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 806 of file stl_multimap.h.

```
4.837.3.27 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>
>::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.
-----	---

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

Definition at line 821 of file stl_multimap.h.

```
4.837.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::max_size
( ) const [inline], [noexcept]
```

Returns the maximum size of the multimap.

Definition at line 465 of file `stl_multimap.h`.

```
4.837.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::noexcept (
is_nothrow_copy_constructible<_Compare>::value ) [inline]
```

Multimap move constructor.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The newly-created multimap contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified multimap.

Definition at line 191 of file `stl_multimap.h`.

```
4.837.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::noexcept (
is_nothrow_copy_constructible<_Compare>::value && _Alloc_traits::_S_always_equal() ) [inline]
```

Allocator-extended move constructor.

Definition at line 221 of file `stl_multimap.h`.

```
4.837.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc>
>::operator= ( const multimap<_Key, _Tp, _Compare, _Alloc> & __x ) [inline]
```

Multimap assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 287 of file `stl_multimap.h`.

```
4.837.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc>
>::operator= ( multimap<_Key, _Tp, _Compare, _Alloc> && __x ) [inline], [noexcept]
```

Multimap move assignment operator.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this multimap (without copying). `__x` is a valid, but unspecified multimap.

Definition at line 302 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::clear()`, and `std::multimap<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.837.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc>
>::operator= ( initializer_list<value_type> __l ) [inline]
```

Multimap list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 328 of file `stl_multimap.h`.

References `std::multimap< _Key, _Tp, _Compare, _Alloc >::clear()`, and `std::multimap< _Key, _Tp, _Compare, _Alloc >::insert()`.

4.837.3.34 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::rbegin () [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 384 of file `stl_multimap.h`.

4.837.3.35 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 393 of file `stl_multimap.h`.

4.837.3.36 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 402 of file `stl_multimap.h`.

4.837.3.37 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 411 of file `stl_multimap.h`.

4.837.3.38 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size ()
const [inline], [noexcept]`

Returns the size of the multimap.

Definition at line 460 of file `stl_multimap.h`.

```
4.837.3.39  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap<_Key, _Tp, _Compare, _Alloc  
            >::upper_bound ( const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 831 of file stl_multimap.h.

```
4.837.3.40 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc
>::upper_bound ( const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 841 of file stl_multimap.h.

```
4.837.3.41 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> value_compare std::multimap<_Key, _Tp, _Compare, _Alloc
>::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

Definition at line 751 of file stl_multimap.h.

4.837.4 Member Data Documentation

```
4.837.4.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc >::iterator
```

Inserts a std::pair into the multimap.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 573 of file stl_multimap.h.

4.837.4.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::void`

Swaps data with another multimap.

Parameters

<code>__x</code>	A multimap of the same element and allocator types.
------------------	---

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 725 of file `stl_multimap.h`.

4.839.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>class std::multiset<_Key, _Compare, _Alloc >

A standard container made up of elements, which can be retrieved in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a [multiset](#)<Key> the key_type and value_type are Key.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

Definition at line 92 of file stl_multiset.h.

4.839.2 Constructor & Destructor Documentation

4.839.2.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc >::multiset () [inline]

Default constructor creates no elements.

Definition at line 140 of file stl_multiset.h.

4.839.2.2 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::multiset (const _Compare & __comp, const allocator_type & __a =
allocator_type()) [inline], [explicit]`

Creates a multiset with no elements.

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

Definition at line 149 of file `stl_multiset.h`.

```
4.839.2.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset ( _InputIterator __first,
_InputIterator __last ) [inline]
```

Builds a multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multiset consisting of copies of the elements from `[first,last)`. This is linear in N if the range is already sorted, and $N\log N$ otherwise (where N is `distance(__first,__last)`).

Definition at line 163 of file `stl_multiset.h`.

```
4.839.2.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset ( _InputIterator __first,
_InputIterator __last, const _Compare & __comp, const allocator_type & __a = allocator_type() )
[inline]
```

Builds a multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and $N\log N$ otherwise (where N is `distance(__first,__last)`).

Definition at line 179 of file `stl_multiset.h`.

```
4.839.2.5 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset ( const multiset< _Key, _Compare, _Alloc > & __x )
[inline]
```

Multiset copy constructor.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The newly-created multiset uses a copy of the allocation object used by `__x`.

Definition at line 192 of file `stl_multiset.h`.

```
4.839.2.6 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset ( initializer_list< value_type > __l, const _Compare & __comp
= _Compare(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds a multiset from an `initializer_list`.

Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 217 of file `stl_multiset.h`.

```
4.839.2.7  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset< _Key, _Compare, _Alloc >::multiset ( const allocator_type & __a )  [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 225 of file `stl_multiset.h`.

```
4.839.2.8  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset< _Key, _Compare, _Alloc >::multiset ( const multiset< _Key, _Compare, _Alloc > & __m, const
            allocator_type & __a )  [inline]
```

Allocator-extended copy constructor.

Definition at line 229 of file `stl_multiset.h`.

```
4.839.2.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset< _Key, _Compare, _Alloc >::multiset ( initializer_list< value_type > __l, const allocator_type & __a
            )  [inline]
```

Allocator-extended initializer-list constructor.

Definition at line 239 of file `stl_multiset.h`.

```
4.839.2.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset ( _InputIterator __first,
            _InputIterator __last, const allocator_type & __a )  [inline]
```

Allocator-extended range constructor.

Definition at line 245 of file `stl_multiset.h`.

4.839.3 Member Function Documentation

```
4.839.3.1  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::multiset< _Key, _Compare, _Alloc >::begin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 330 of file `stl_multiset.h`.

```
4.839.3.2  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::multiset< _Key, _Compare, _Alloc >::cbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 367 of file `stl_multiset.h`.

4.839.3.3 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset<_Key, _Compare, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 376 of file `stl_multiset.h`.

4.839.3.4 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::multiset<_Key, _Compare, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 654 of file `stl_multiset.h`.

Referenced by `std::multiset<_Key, _Compare, _Alloc>::operator=()`.

4.839.3.5 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset<_Key, _Compare, _Alloc>::count (const key_type & __x) const [inline]`

Finds the number of elements with given key.

Parameters

<code>__x</code>	Key of elements to be located.
------------------	--------------------------------

Returns

Number of elements with specified key.

Definition at line 665 of file `stl_multiset.h`.

4.839.3.6 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 385 of file `stl_multiset.h`.

4.839.3.7 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 394 of file `stl_multiset.h`.

4.839.3.8 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args> iterator std::multiset<_Key, _Compare, _Alloc>::emplace (_Args &&... __args)
[inline]`

Builds and inserts an element into the multiset.

Parameters

<code>__args</code>	Arguments used to generate the element instance to be inserted.
---------------------	---

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 447 of file `stl_multiset.h`.

```
4.839.3.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
           template<typename... _Args> iterator std::multiset<_Key, _Compare, _Alloc>::emplace_hint ( const_iterator __pos,
           _Args &&... __args ) [inline]
```

Builds and inserts an element into the multiset.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 473 of file `stl_multiset.h`.

```
4.839.3.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool
           std::multiset<_Key, _Compare, _Alloc>::empty ( ) const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 400 of file `stl_multiset.h`.

```
4.839.3.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
           std::multiset<_Key, _Compare, _Alloc>::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 339 of file `stl_multiset.h`.

```
4.839.3.12 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::pair<iterator, iterator> std::multiset<_Key, _Compare, _Alloc>::equal_range ( const key_type & __x )
            [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 745 of file stl_multiset.h.

```
4.839.3.13  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             std::pair<const_iterator, const_iterator> std::multiset<_Key, _Compare, _Alloc>::equal_range ( const key_type
             &__x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 749 of file stl_multiset.h.

```
4.839.3.14  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             _GLIBCXX_ABI_TAG_CXX11 iterator std::multiset<_Key, _Compare, _Alloc>::erase ( const_iterator __position )
             [inline]
```

Erases an element from a multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 575 of file stl_multiset.h.

```
4.839.3.15  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            size_type std::multiset< _Key, _Compare, _Alloc >::erase ( const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 605 of file stl_multiset.h.

```
4.839.3.16  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            _GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase ( const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [first,last) range of elements from a multiset.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 627 of file stl_multiset.h.

```
4.839.3.17  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::multiset< _Key, _Compare, _Alloc >::find ( const key_type & __x )  [inline]
```

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 683 of file `stl_multiset.h`.

```
4.839.3.18  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            const_iterator std::multiset< _Key, _Compare, _Alloc >::find ( const key_type & __x ) const  [inline]
```

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 687 of file `stl_multiset.h`.

```
4.839.3.19  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator ( ) const  [inline],[noexcept]
```

Returns the memory allocation object.

Definition at line 321 of file `stl_multiset.h`.

```
4.839.3.20  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::multiset< _Key, _Compare, _Alloc >::insert ( const value_type & __x )  [inline]
```

Inserts an element into the multiset.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 492 of file `stl_multiset.h`.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::insert()`, and `std::multiset< _Key, _Compare, _Alloc >::operator=()`.

4.839.3.21 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset<_Key,_Compare,_Alloc>::insert(const_iterator __position, const value_type & __x) [inline]`

Inserts an element into the multiset.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 522 of file `stl_multiset.h`.

```
4.839.3.22 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator > void std::multiset<_Key, _Compare, _Alloc >::insert ( _InputIterator __first,
_InputIterator __last ) [inline]
```

A template function that tries to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 541 of file `stl_multiset.h`.

```
4.839.3.23 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::multiset<_Key, _Compare, _Alloc >::insert ( initializer_list<value_type> __l ) [inline]
```

Attempts to insert a list of elements into the multiset.

Parameters

<code>__l</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 553 of file `stl_multiset.h`.

References `std::multiset<_Key, _Compare, _Alloc >::insert()`.

```
4.839.3.24 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::multiset<_Key, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the comparison object.

Definition at line 313 of file `stl_multiset.h`.

```
4.839.3.25 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset<_Key, _Compare, _Alloc >::lower_bound ( const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.
-----	--------------------

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 704 of file stl_multiset.h.

```
4.839.3.26 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.
-----	--------------------

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 708 of file stl_multiset.h.

```
4.839.3.27 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the set.

Definition at line 410 of file stl_multiset.h.

```
4.839.3.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::noexcept ( is_nothrow_copy_constructible< _Compare >::value )
[inline]
```

Multiset move constructor.

Parameters

__x	A multiset of identical element and allocator types.
-----	--

The newly-created multiset contains the exact contents of __x. The contents of __x are a valid, but unspecified multiset.

Definition at line 204 of file stl_multiset.h.

```
4.839.3.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::noexcept ( is_nothrow_copy_constructible< _Compare >::value
&& _Alloc_traits::_S_always_equal() ) [inline]
```

Allocator-extended move constructor.

Definition at line 234 of file stl_multiset.h.

```
4.839.3.30  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            multiset& std::multiset<_Key, _Compare, _Alloc >::operator= ( const multiset<_Key, _Compare, _Alloc > & __x
            ) [inline]
```

Multiset assignment operator.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 259 of file `stl_multiset.h`.

```
4.839.3.31 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( multiset< _Key, _Compare, _Alloc > && __x )
    [inline], [noexcept]
```

Multiset move assignment operator.

Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this multiset (without copying). `__x` is a valid, but unspecified multiset.

Definition at line 275 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::clear()`, and `std::multiset< _Key, _Compare, _Alloc >::insert()`.

```
4.839.3.32 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( initializer_list< value_type > __l )
    [inline]
```

Multiset list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 301 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::clear()`, and `std::multiset< _Key, _Compare, _Alloc >::insert()`.

```
4.839.3.33 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 348 of file `stl_multiset.h`.

```
4.839.3.34 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 357 of file `stl_multiset.h`.

```
4.839.3.35 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    size_type std::multiset< _Key, _Compare, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the set.

Definition at line 405 of file `stl_multiset.h`.

4.839.3.36 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset<_Key, _Compare, _Alloc>::upper_bound (const key_type & __x) [inline]`

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 720 of file `stl_multiset.h`.

4.839.3.37 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset<_Key, _Compare, _Alloc>::upper_bound (const key_type & __x) const [inline]`

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 724 of file `stl_multiset.h`.

4.839.3.38 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::multiset<_Key, _Compare, _Alloc>::value_comp () const [inline]`

Returns the comparison object.

Definition at line 317 of file `stl_multiset.h`.

4.839.4 Member Data Documentation

4.839.4.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset<_Key, _Compare, _Alloc>::void`

Swaps data with another multiset.

Parameters

<code>__x</code>	A multiset of the same element and allocator types.
------------------	---

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 429 of file `stl_multiset.h`.

4.842.1 Detailed Description

`template<typename _IntType = int>class std::negative_binomial_distribution< _IntType >`

A `negative_binomial_distribution` random number distribution.

The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

Definition at line 4208 of file `random.h`.

4.842.2 Member Typedef Documentation

4.842.2.1 `template<typename _IntType = int> typedef _IntType std::negative_binomial_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 4211 of file `random.h`.

4.842.3 Member Function Documentation

4.842.3.1 `template<typename _IntType = int> _IntType std::negative_binomial_distribution< _IntType >::k () const`
`[inline]`

Return the k parameter of the distribution.

Definition at line 4266 of file `random.h`.

4.842.3.2 `template<typename _IntType = int> result_type std::negative_binomial_distribution< _IntType >::max ()`
`const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4302 of file `random.h`.

References `std::numeric_limits< _Tp >::max()`.

4.842.3.3 `template<typename _IntType = int> result_type std::negative_binomial_distribution< _IntType >::min ()`
`const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4295 of file `random.h`.

4.842.3.4 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type`
`std::negative_binomial_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng)`

Generating functions.

4.842.3.5 `template<typename _IntType = int> double std::negative_binomial_distribution< _IntType >::p () const`
`[inline]`

Return the p parameter of the distribution.

Definition at line 4273 of file random.h.

4.842.3.6 `template<typename _IntType = int> param_type std::negative_binomial_distribution< _IntType >::param ()`
`const [inline]`

Returns the parameter set of the distribution.

Definition at line 4280 of file random.h.

4.842.3.7 `template<typename _IntType = int> void std::negative_binomial_distribution< _IntType >::param (const`
`param_type &__param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4288 of file random.h.

4.842.3.8 `template<typename _IntType = int> void std::negative_binomial_distribution< _IntType >::reset ()`
`[inline]`

Resets the distribution state.

Definition at line 4259 of file random.h.

References `std::gamma_distribution< _RealType >::reset()`.

4.842.4 Friends And Related Function Documentation

4.842.4.1 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits >`
`std::basic_ostream< _CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > &__os, const`
`std::negative_binomial_distribution< _IntType1 > &__x) [friend]`

Inserts a `negative_binomial_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.842.4.2 `template<typename _IntType = int> bool operator== (const negative_binomial_distribution< _IntType > &__d1,`
`const negative_binomial_distribution< _IntType > &__d2) [friend]`

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4351 of file random.h.

4.842.4.3 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits > & __is,
std::negative_binomial_distribution<_IntType1 > & __x) [friend]`

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.845.4.4 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator >`
`normal_distribution< _RealType>::result_type std::normal_distribution< _RealType >::operator() (`
`_UniformRandomNumberGenerator & __urng, const param_type & __param)`

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

Definition at line 1935 of file bits/random.tcc.

References `std::log()`, and `std::sqrt()`.

4.845.4.5 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator > result_type`
`std::normal_distribution< _RealType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 2195 of file random.h.

Referenced by `std::normal_distribution< result_type >::operator()()`.

4.845.4.6 `template<typename _RealType = double> param_type std::normal_distribution< _RealType >::param () const`
`[inline]`

Returns the parameter set of the distribution.

Definition at line 2165 of file random.h.

4.845.4.7 `template<typename _RealType = double> void std::normal_distribution< _RealType >::param (const`
`param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2173 of file random.h.

4.845.4.8 `template<typename _RealType = double> void std::normal_distribution< _RealType >::reset () [inline]`

Resets the distribution state.

Definition at line 2144 of file random.h.

Referenced by `std::lognormal_distribution< _RealType >::reset()`, `std::gamma_distribution< result_type >::reset()`, `std::student_t_distribution< _RealType >::reset()`, `std::binomial_distribution< _IntType >::reset()`, and `std::poisson_distribution< _IntType >::reset()`.

4.845.4.9 `template<typename _RealType = double> _RealType std::normal_distribution<_RealType>::stddev () const`
`[inline]`

Returns the standard deviation of the distribution.

Definition at line 2158 of file random.h.

4.845.5 Friends And Related Function Documentation

4.845.5.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits>`
`std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::normal_distribution<_RealType1> & __x) [friend]`

Inserts a normal_distribution random number distribution __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A normal_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.845.5.2 `template<typename _RealType = double> template<typename _RealType1> bool operator== (const`
`std::normal_distribution<_RealType1> & __d1, const std::normal_distribution<_RealType1> & __d2)`
`[friend]`

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

4.845.5.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits>`
`> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,`
`std::normal_distribution<_RealType1> & __x) [friend]`

Extracts a normal_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A normal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.848.1 Detailed Description

`template<typename _CharT, typename _InIter> class std::num_get<_CharT, _InIter>`

Primary class template `num_get`.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The `num_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_get` facet.

Definition at line 1915 of file `locale_facets.h`.

4.848.2 Member Typedef Documentation

4.848.2.1 `template<typename _CharT, typename _InIter> typedef _CharT std::num_get<_CharT, _InIter>::char_type`

4.848.3 Constructor & Destructor Documentation

4.848.3.1 `template<typename _CharT, typename _Inlter > std::num_get< _CharT, _Inlter >::num_get (size_t __refs = 0)
[inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1936 of file locale_facets.h.

4.848.3.2 `template<typename _CharT, typename _Inlter > virtual std::num_get< _CharT, _Inlter >::~~num_get ()
[inline], [protected], [virtual]`

Destructor.

Definition at line 2108 of file locale_facets.h.

4.848.4 Member Function Documentation

4.848.4.1 `template<typename _CharT, typename _Inlter > _Inlter std::num_get< _CharT, _Inlter >::do_get (iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, bool & __v) const [protected],
[virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 590 of file locale_facets.tcc.

References `std::ios_base::M_getloc()`, `std::ios_base::boolalpha`, `std::ios_base::eofbit`, `std::ios_base::failbit`, `std::ios_base::flags()`, and `std::ios_base::goodbit`.

4.848.4.2 `template<typename _CharT, typename _Inlter > virtual iter_type std::num_get< _CharT, _Inlter >::do_get (iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v) const [inline],
[protected], [virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2176 of file locale_facets.h.

```
4.848.4.3 template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (

    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2181 of file locale_facets.h.

```
4.848.4.4 template<typename _CharT, typename _InIter > virtual iter_type std::num_get<_CharT, _InIter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned int & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See Also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2186 of file locale_facets.h.

```
4.848.4.5  template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See Also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 733 of file locale_facets.tcc.

References `std::basic_string< _CharT, _Traits, _Alloc >::c_str()`, `std::ios_base::eofbit`, and `std::basic_string< _CharT, _Traits, _Alloc >::reserve()`.

```
4.848.4.11 template<typename _CharT, typename _InIter > _InIter std::num_get< _CharT, _InIter >::do_get( iter_type
    __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, void *& __v ) const    [protected],
    [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See Also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 748 of file locale_facets.tcc.

References `std::ios_base::basefield`, `std::ios_base::flags()`, and `std::ios_base::hex`.

```
4.848.4.12 template<typename _CharT, typename _InIter > iter_type std::num_get< _CharT, _InIter >::get( iter_type __in,
    iter_type __end, ios_base & __io, ios_base::iostate & __err, bool & __v ) const    [inline]
```

Numeric parsing.

Parses the input stream into the bool `v`. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Sets `v` to true or false if successful. Sets `err` to `ios_base::failbit` if reading the string fails. Sets `err` to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets `v` to true, if the value is 0, sets `v` to false, and otherwise set `err` to `ios_base::failbit`.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1962 of file `locale_facets.h`.

Referenced by `std::basic_istream<_CharT, _Traits>::operator>>()`.

4.848.4.13 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1999 of file `locale_facets.h`.

4.848.4.14 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned short & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2004 of file `locale_facets.h`.

4.848.4.15 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned int & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2009 of file `locale_facets.h`.

4.848.4.16 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long & __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2014 of file `locale_facets.h`.

```

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2020 of file `locale_facets.h`.

```
4.848.4.18 template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in,
iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long long & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2025 of file locale_facets.h.

```
4.848.4.19 template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get( iter_type __in,
iter_type __end, ios_base & __io, ios_base::iostate & __err, float & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2059 of file locale_facets.h.

```
4.848.4.20 template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get( iter_type __in,
iter_type __end, ios_base & __io, ios_base::iostate & __err, double & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2064 of file `locale_facets.h`.

```
4.848.4.21  template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in,
            iter_type __end, ios_base & __io, ios_base::iostate & __err, long double & __v ) const  [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2069 of file `locale_facets.h`.

```
4.848.4.22  template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in,
            iter_type __end, ios_base & __io, ios_base::iostate & __err, void *& __v ) const  [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf p` specifier.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2102 of file `locale_facets.h`.

4.849.1 Detailed Description

template<typename _CharT, typename _Outiter>class std::num_put<_CharT, _Outiter>

Primary class template num_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.

The num_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_put facet.

Definition at line 2254 of file locale_facets.h.

4.849.2 Member Typedef Documentation

4.849.3 Constructor & Destructor Documentation

4.849.3.1 template<typename _CharT, typename _Outiter> std::num_put<_CharT, _Outiter>::num_put (size_t __refs = 0) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.
---------------	---------------------------------

Definition at line 2275 of file locale_facets.h.

4.849.3.2 template<typename _CharT, typename _Outiter> virtual std::num_put<_CharT, _Outiter>::~~num_put () [inline], [protected], [virtual]

Destructor.

Definition at line 2454 of file locale_facets.h.

4.849.4 Member Function Documentation

4.849.4.1 `template<typename _CharT, typename _Outiter > _Outiter std::num_put< _CharT, _Outiter >::do_put (iter_type __s, ios_base & __io, char_type __fill, bool __v) const` `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1089 of file `locale_facets.tcc`.

References `std::ios_base::_M_getloc()`, `std::ios_base::adjustfield`, `std::ios_base::boolalpha`, `std::ios_base::flags()`, `std::ios_base::left`, and `std::ios_base::width()`.

4.849.4.2 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put< _CharT, _Outiter >::do_put (iter_type __s, ios_base & __io, char_type __fill, long __v) const` `[inline]`, `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2474 of file `locale_facets.h`.

4.849.4.3 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put< _CharT, _Outiter >::do_put (iter_type __s, ios_base & __io, char_type __fill, unsigned long __v) const` `[inline]`, `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2478 of file locale_facets.h.

```
4.849.4.4 template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put
( iter_type __s, ios_base & __io, char_type __fill, long long __v ) const    [inline], [protected],
[virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2484 of file locale_facets.h.

```
4.849.4.5 template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put (
iter_type __s, ios_base & __io, char_type __fill, unsigned long long __v ) const    [inline], [protected],
[virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2489 of file locale_facets.h.

4.849.4.6 `template<typename _CharT, typename _Outiter > _Outiter std::num_put< _CharT, _Outiter >::do_put (iter_type __s, ios_base & __io, char_type __fill, double __v) const [protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1141 of file `locale_facets.tcc`.

4.849.4.7 `template<typename _CharT, typename _Outiter > _Outiter std::num_put< _CharT, _Outiter >::do_put (iter_type __s, ios_base & __io, char_type __fill, long double __v) const [protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1155 of file `locale_facets.tcc`.

4.849.4.8 `template<typename _CharT, typename _Outiter > _Outiter std::num_put< _CharT, _Outiter >::do_put (iter_type __s, ios_base & __io, char_type __fill, const void * __v) const [protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.

<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1162 of file locale_facets.tcc.

References `std::ios_base::flags()`, `std::ios_base::hex`, and `std::ios_base::uppercase`.

4.849.4.9 `template<typename _CharT, typename _OutIter> iter_type std::num_put<_CharT, _OutIter>::put (iter_type __s, ios_base & __io, char_type __fill, bool __v) const [inline]`

Numeric formatting.

Formats the boolean `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truenamex()` or `ctype<CharT>::falsenamex()`. Otherwise formats `v` as an int.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2293 of file locale_facets.h.

4.849.4.10 `template<typename _CharT, typename _OutIter> iter_type std::num_put<_CharT, _OutIter>::put (iter_type __s, ios_base & __io, char_type __fill, long __v) const [inline]`

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf` `o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2335 of file locale_facets.h.

4.849.4.11 `template<typename _CharT, typename _Outiter> iter_type std::num_put<_CharT, _Outiter>::put (iter_type __s, ios_base & __io, char_type __fill, unsigned long __v) const [inline]`

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2339 of file locale_facets.h.

4.849.4.12 `template<typename _CharT, typename _Outiter> iter_type std::num_put<_CharT, _Outiter>::put (iter_type __s, ios_base & __io, char_type __fill, long long __v) const [inline]`

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively.

Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2345 of file locale_facets.h.

4.849.4.13 `template<typename _CharT, typename _OutIter> iter_type std::num_put<_CharT, _OutIter>::put(iter_type __s, ios_base & __io, char_type __fill, unsigned long long __v) const [inline]`

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2349 of file locale_facets.h.

4.849.4.14 `template<typename _CharT, typename _Outiter > iter_type std::num_put< _CharT, _Outiter >::put (iter_type __s, ios_base & __io, char_type __fill, double __v) const [inline]`

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like *e* or *E* with `ios_base::uppercase` unset or set respectively. Otherwise, formats like *g* or *G* depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like *g* or *G*.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2398 of file `locale_facets.h`.

4.849.4.15 `template<typename _CharT, typename _Outiter > iter_type std::num_put< _CharT, _Outiter >::put (iter_type __s, ios_base & __io, char_type __fill, long double __v) const [inline]`

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like *e* or *E* with `ios_base::uppercase` unset or set respectively. Otherwise, formats like *g* or *G* depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like *g* or *G*.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2402 of file `locale_facets.h`.

4.849.4.16 `template<typename _CharT, typename _Outlter > iter_type std::num_put<_CharT, _Outlter >::put (iter_type __s, ios_base & __io, char_type __fill, const void * __v) const [inline]`

Numeric formatting.

Formats the pointer value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

This function formats `v` as an unsigned long with `ios_base::hex` and `ios_base::showbase` set.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2423 of file `locale_facets.h`.

4.850.1 Detailed Description

template<typename _Tp>struct std::numeric_limits< _Tp >

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

_GLIBCXX_RESOLVE_LIB_DEFECTS: DRs 201 and 184 (hi Gaby!) are noted, but not incorporated in this documented (yet).

Definition at line 304 of file limits.

4.850.2 Member Function Documentation

4.850.2.1 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::denorm_min () [inline],
[static], [noexcept]

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

Definition at line 349 of file limits.

4.850.2.2 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::epsilon () [inline],
[static], [noexcept]

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable.

Definition at line 325 of file limits.

Referenced by `std::poisson_distribution< _IntType >::operator()()`, and `std::binomial_distribution< _IntType >::operator()()`.

4.850.2.3 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::infinity () [inline],
[static], [noexcept]

The representation of positive infinity, if `has_infinity`.

Definition at line 333 of file limits.

4.850.2.4 template<typename _Tp > static constexpr _Tp std::numeric_limits< _Tp >::lowest () [inline],
[static], [noexcept]

A finite value `x` such that there is no other finite value `y` where `y < x`.

Definition at line 319 of file limits.

Referenced by `std::normal_distribution< result_type >::min()`, `std::cauchy_distribution< _RealType >::min()`, `std::student_t_distribution< _RealType >::min()`, and `std::extreme_value_distribution< _RealType >::min()`.

4.850.2.5 `template<typename _Tp> static constexpr _Tp std::numeric_limits<_Tp>::max () [inline],
[static], [noexcept]`

The maximum finite value.

Definition at line 313 of file limits.

Referenced by `std::normal_distribution< result_type >::max()`, `std::lognormal_distribution< _RealType >::max()`, `std::gamma_distribution< result_type >::max()`, `std::chi_squared_distribution< _RealType >::max()`, `std::cauchy_distribution< _RealType >::max()`, `std::fisher_f_distribution< _RealType >::max()`, `std::student_t_distribution< _RealType >::max()`, `std::bernoulli_distribution::max()`, `std::geometric_distribution< _IntType >::max()`, `std::negative_binomial_distribution< _IntType >::max()`, `std::poisson_distribution< _IntType >::max()`, `std::exponential_distribution< _RealType >::max()`, `std::weibull_distribution< _RealType >::max()`, `std::extreme_value_distribution< _RealType >::max()`, `std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size()`, `std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()()`, `std::poisson_distribution< _IntType >::operator()()`, and `std::binomial_distribution< _IntType >::operator()()`.

4.850.2.6 `template<typename _Tp> static constexpr _Tp std::numeric_limits<_Tp>::min () [inline], [static],
[noexcept]`

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Definition at line 309 of file limits.

Referenced by `std::bernoulli_distribution::min()`, and `std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()()`.

4.850.2.7 `template<typename _Tp> static constexpr _Tp std::numeric_limits<_Tp>::quiet_NaN () [inline],
[static], [noexcept]`

The representation of a quiet Not a Number, if `has_quiet_NaN`.

Definition at line 338 of file limits.

4.850.2.8 `template<typename _Tp> static constexpr _Tp std::numeric_limits<_Tp>::round_error () [inline],
[static], [noexcept]`

The maximum rounding error measurement (see LIA-1).

Definition at line 329 of file limits.

4.850.2.9 `template<typename _Tp> static constexpr _Tp std::numeric_limits<_Tp>::signaling_NaN () [inline],
[static], [noexcept]`

The representation of a signaling Not a Number, if `has_signaling_NaN`.

Definition at line 343 of file limits.

4.850.3 Member Data Documentation

4.850.3.1 `constexpr int std::__numeric_limits_base::digits [static], [inherited]`

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Definition at line 200 of file limits.

4.850.3.2 `constexpr int std::__numeric_limits_base::digits10` `[static], [inherited]`

The number of base 10 digits that can be represented without change.

Definition at line 203 of file `limits`.

4.850.3.3 `constexpr float_denorm_style std::__numeric_limits_base::has_denorm` `[static], [inherited]`

See `std::float_denorm_style` for more information.

Definition at line 255 of file `limits`.

4.850.3.4 `constexpr bool std::__numeric_limits_base::has_denorm_loss` `[static], [inherited]`

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

Definition at line 259 of file `limits`.

4.850.3.5 `constexpr bool std::__numeric_limits_base::has_infinity` `[static], [inherited]`

True if the type has a representation for positive infinity.

Definition at line 244 of file `limits`.

4.850.3.6 `constexpr bool std::__numeric_limits_base::has_quiet_NaN` `[static], [inherited]`

True if the type has a representation for a quiet (non-signaling) Not a Number.

Definition at line 248 of file `limits`.

4.850.3.7 `constexpr bool std::__numeric_limits_base::has_signaling_NaN` `[static], [inherited]`

True if the type has a representation for a signaling Not a Number.

Definition at line 252 of file `limits`.

4.850.3.8 `constexpr bool std::__numeric_limits_base::is_bounded` `[static], [inherited]`

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

Definition at line 268 of file `limits`.

4.850.3.9 `constexpr bool std::__numeric_limits_base::is_exact` `[static], [inherited]`

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

Definition at line 220 of file `limits`.

4.850.3.10 `constexpr bool std::__numeric_limits_base::is_iec559` `[static], [inherited]`

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

Definition at line 263 of file `limits`.

4.850.3.11 `constexpr bool std::__numeric_limits_base::is_integer` `[static], [inherited]`

True if the type is integer.

Definition at line 215 of file `limits`.

4.850.3.12 `constexpr bool std::__numeric_limits_base::is_modulo` `[static],[inherited]`

True if the type is *modulo*. A type is modulo if, for any operation involving `+`, `-`, or `*` on values of that type whose result would fall outside the range `[min(),max())`, the value returned differs from the true value by an integer multiple of `max() - min() + 1`. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

Definition at line 277 of file `limits`.

4.850.3.13 `constexpr bool std::__numeric_limits_base::is_signed` `[static],[inherited]`

True if the type is signed.

Definition at line 212 of file `limits`.

4.850.3.14 `constexpr bool std::__numeric_limits_base::is_specialized` `[static],[inherited]`

This will be true for all fundamental types (which have specializations), and false for everything else.

Definition at line 195 of file `limits`.

4.850.3.15 `constexpr int std::__numeric_limits_base::max_digits10` `[static],[inherited]`

The number of base 10 digits required to ensure that values which differ are always differentiated.

Definition at line 208 of file `limits`.

4.850.3.16 `constexpr int std::__numeric_limits_base::max_exponent` `[static],[inherited]`

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

Definition at line 237 of file `limits`.

4.850.3.17 `constexpr int std::__numeric_limits_base::max_exponent10` `[static],[inherited]`

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

Definition at line 241 of file `limits`.

4.850.3.18 `constexpr int std::__numeric_limits_base::min_exponent` `[static],[inherited]`

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

Definition at line 228 of file `limits`.

4.850.3.19 `constexpr int std::__numeric_limits_base::min_exponent10` `[static],[inherited]`

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

Definition at line 232 of file `limits`.

4.850.3.20 `constexpr int std::__numeric_limits_base::radix` `[static],[inherited]`

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Definition at line 224 of file `limits`.

4.850.3.21 `constexpr float_round_style std::__numeric_limits_base::round_style` `[static], [inherited]`

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

Definition at line 288 of file `limits`.

4.850.3.22 `constexpr bool std::__numeric_limits_base::tinyness_before` `[static], [inherited]`

True if tininess is detected before rounding. (see IEC 559)

Definition at line 283 of file `limits`.

4.850.3.23 `constexpr bool std::__numeric_limits_base::traps` `[static], [inherited]`

True if trapping is implemented for this type.

Definition at line 280 of file `limits`.

4.869.1 Detailed Description

template<typename _CharT>class std::numpunct<_CharT>

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

Definition at line 1641 of file locale_facets.h.

4.869.2 Member Typedef Documentation

4.869.2.1 template<typename _CharT> typedef _CharT std::numpunct<_CharT>::char_type

Public typedefs.

Definition at line 1647 of file locale_facets.h.

4.869.2.2 template<typename _CharT> typedef basic_string<_CharT> std::numpunct<_CharT>::string_type

Public typedefs.

Definition at line 1648 of file locale_facets.h.

4.869.3 Constructor & Destructor Documentation

4.869.3.1 `template<typename _CharT> std::numpunct<_CharT>::numpunct (size_t __refs = 0) [inline],
[explicit]`

Numpunct constructor.

Parameters

<code>__refs</code>	RefCount to pass to the base class.
---------------------	-------------------------------------

Definition at line 1665 of file locale_facets.h.

4.869.3.2 `template<typename _CharT> std::numpunct<_CharT>::numpunct (__cache_type * __cache, size_t __refs = 0) [inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

<code>__cache</code>	<code>__numpunct_cache</code> object.
<code>__refs</code>	RefCount to pass to the base class.

Definition at line 1679 of file locale_facets.h.

4.869.3.3 `template<typename _CharT> std::numpunct<_CharT>::numpunct (__c_locale __cloc, size_t __refs = 0) [inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	RefCount to pass to the base class.

Definition at line 1693 of file locale_facets.h.

4.869.3.4 `template<typename _CharT> virtual std::numpunct<_CharT>::~~numpunct () [protected],
[virtual]`

Destructor.

4.869.4 Member Function Documentation

4.869.4.1 `template<typename _CharT> char_type std::numpunct<_CharT>::decimal_point () const [inline]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning num_punct<char_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1707 of file locale_facets.h.

4.869.4.2 `template<typename _CharT> virtual char_type std::num_punct<_CharT>::do_decimal_point () const`
[inline], [protected], [virtual]

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1794 of file `locale_facets.h`.

4.869.4.3 `template<typename _CharT> virtual string_type std::num_punct<_CharT>::do_falsename () const`
[inline], [protected], [virtual]

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Definition at line 1845 of file `locale_facets.h`.

4.869.4.4 `template<typename _CharT> virtual string std::num_punct<_CharT>::do_grouping () const` [inline],
[protected], [virtual]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See Also

`grouping()` for details.

Returns

String representing grouping specification.

Definition at line 1819 of file `locale_facets.h`.

4.869.4.5 `template<typename _CharT> virtual char_type std::num_punct<_CharT>::do_thousands_sep () const`
[inline], [protected], [virtual]

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1806 of file `locale_facets.h`.

4.869.4.6 `template<typename _CharT> virtual string_type std::numpunct<_CharT>::do_truename () const`
`[inline], [protected], [virtual]`

Return string representation of bool true.

Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Definition at line 1832 of file locale_facets.h.

4.869.4.7 `template<typename _CharT> string_type std::numpunct<_CharT>::falsename () const` `[inline]`

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling numpunct<char_type>::do_falsename().

Returns

string_type representing printed form of false.

Definition at line 1777 of file locale_facets.h.

4.869.4.8 `template<typename _CharT> string std::numpunct<_CharT>::grouping () const` `[inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling numpunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1751 of file locale_facets.h.

4.869.4.9 `template<typename _CharT> char_type std::numpunct<_CharT>::thousands_sep () const` `[inline]`

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1720 of file locale_facets.h.

4.869.4.10 template<typename _CharT> string_type std::num_punct<_CharT>::truename () const [inline]

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling num_punct<char_type>::do_truename().

Returns

string_type representing printed form of true.

Definition at line 1764 of file locale_facets.h.

4.869.5 Member Data Documentation

4.869.5.1 template<typename _CharT> locale::id std::num_punct<_CharT>::id [static]

Numpunct facet id.

Definition at line 1657 of file locale_facets.h.

4.872.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an operator `<<(Tp)` defined.

Template Parameters

<code>_Tp</code>	The type to write to the ostream.
<code>_CharT</code>	The ostream char_type.
<code>_Traits</code>	The ostream char_traits.

Definition at line 154 of file stream_iterator.h.

4.872.2 Member Typedef Documentation

4.872.2.1 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type`

Public typedef.

Definition at line 160 of file stream_iterator.h.

4.872.2.2 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type` [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl_iterator_base_types.h.

4.872.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category` [inherited]

One of the [tag types](#).

Definition at line 121 of file stl_iterator_base_types.h.

4.872.2.4 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_type`

Public typedef.

Definition at line 162 of file stream_iterator.h.

4.872.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer` [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file stl_iterator_base_types.h.

4.872.2.6 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference` [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file stl_iterator_base_types.h.

4.872.2.7 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type`

Public typedef.

Definition at line 161 of file stream_iterator.h.

4.872.2.8 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type` [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.872.3 Constructor & Destructor Documentation

4.872.3.1 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (ostream_type & __s) [inline]`

Construct from an ostream.

Definition at line 171 of file `stream_iterator.h`.

4.872.3.2 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (ostream_type & __s, const _CharT * __c)
[inline]`

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

<code>__s</code>	Underlying ostream to write to.
<code>__c</code>	<i>CharT</i> delimiter string to insert.

Definition at line 183 of file `stream_iterator.h`.

4.872.3.3 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (const ostream_iterator< _Tp, _CharT,
_Traits > & __obj) [inline]`

Copy constructor.

Definition at line 187 of file `stream_iterator.h`.

4.872.4 Member Function Documentation

4.872.4.1 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> ostream_iterator&
std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (const _Tp & __value) [inline]`

Writes *value* to underlying ostream using `operator<<`. If constructed with delimiter string, writes delimiter to ostream.

Definition at line 193 of file `stream_iterator.h`.

4.873.4 Member Function Documentation

4.873.4.1 `template<typename _CharT, typename _Traits = char_traits<_CharT>> bool std::ostreambuf_iterator<_CharT, _Traits>::failed() const [inline], [noexcept]`

Return true if previous operator=() failed.

Definition at line 275 of file streambuf_iterator.h.

4.873.4.2 `template<typename _CharT, typename _Traits = char_traits<_CharT>> ostreambuf_iterator& std::ostreambuf_iterator<_CharT, _Traits>::operator*() [inline]`

Return *this.

Definition at line 260 of file streambuf_iterator.h.

4.873.4.3 `template<typename _CharT, typename _Traits = char_traits<_CharT>> ostreambuf_iterator& std::ostreambuf_iterator<_CharT, _Traits>::operator++(int) [inline]`

Return *this.

Definition at line 265 of file streambuf_iterator.h.

4.873.4.4 `template<typename _CharT, typename _Traits = char_traits<_CharT>> ostreambuf_iterator& std::ostreambuf_iterator<_CharT, _Traits>::operator++() [inline]`

Return *this.

Definition at line 270 of file streambuf_iterator.h.

4.873.4.5 `template<typename _CharT, typename _Traits = char_traits<_CharT>> ostreambuf_iterator& std::ostreambuf_iterator<_CharT, _Traits>::operator=(_CharT __c) [inline]`

Write character to streambuf. Calls streambuf.sputc().

Definition at line 250 of file streambuf_iterator.h.

References `std::basic_streambuf<_CharT, _Traits>::sputc()`.

4.874 std::out_of_range Class Reference

Inheritance diagram for `std::out_of_range`:

Public Member Functions

- **out_of_range** (const [string](#) &__arg)
- virtual const char * [what](#) () const noexcept

4.874.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in `basic_string`).

Definition at line 100 of file `stdexcept`.

4.874.2 Member Function Documentation

4.874.2.1 `virtual const char* std::logic_error::what () const` `[virtual]`, `[noexcept]`, `[inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.875 `std::output_iterator_tag` Struct Reference

4.875.1 Detailed Description

Marking output iterators.

Definition at line 92 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

4.880.1 Detailed Description

template<class _T1, class _T2>struct std::pair<_T1, _T2>

Struct holding two objects of arbitrary type.

Template Parameters

_T1	Type of first object.
_T2	Type of second object.

Definition at line 96 of file stl_pair.h.

4.880.2 Member Typedef Documentation

4.880.2.1 template<class _T1, class _T2> typedef _T2 std::pair<_T1, _T2>::second_type

[first_type](#) is the first bound type

Definition at line 99 of file stl_pair.h.

4.880.3 Constructor & Destructor Documentation

4.880.3.1 `template<class _T1, class _T2> constexpr std::pair<_T1, _T2>::pair () [inline]`

`second` is a copy of the second object

The default constructor creates `first` and `second` using their respective default constructors.

Definition at line 108 of file `stl_pair.h`.

4.880.3.2 `template<class _T1, class _T2> constexpr std::pair<_T1, _T2>::pair (const _T1 & __a, const _T2 & __b) [inline]`

Two objects may be passed to a `pair` constructor to be copied.

Definition at line 112 of file `stl_pair.h`.

4.880.3.3 `template<class _T1, class _T2> template<class _U1, class _U2, class = typename enable_if<__and<is_convertible<const _U1&, _T1>, is_convertible<const _U2&, _T2>>::value>::type> constexpr std::pair<_T1, _T2>::pair (const pair<_U1, _U2> & __p) [inline]`

There is also a templated copy ctor for the `pair` class itself.

Definition at line 124 of file `stl_pair.h`.

4.880.4 Member Data Documentation

4.880.4.1 `template<class _T1, class _T2> _T1 std::pair<_T1, _T2>::first`

`second_type` is the second bound type

Definition at line 101 of file `stl_pair.h`.

Referenced by `std::_Temporary_buffer<_ForwardIterator, _Tp>::_Temporary_buffer()`, `std::set<_StateIdT>::insert()`, `std::operator==(,)`, and `std::regex_replace()`.

4.880.4.2 `template<class _T1, class _T2> _T2 std::pair<_T1, _T2>::second`

`first` is a copy of the first object

Definition at line 102 of file `stl_pair.h`.

Referenced by `std::_Temporary_buffer<_ForwardIterator, _Tp>::_Temporary_buffer()`, `std::set<_StateIdT>::insert()`, `std::operator==(,)`, and `std::regex_replace()`.

4.881.1 Detailed Description

```
template<typename _RealType = double>class std::piecewise_constant_distribution< _RealType >
```

A `piecewise_constant_distribution` random number distribution.

The formula for the piecewise constant probability mass function is

Definition at line 5481 of file `random.h`.

4.881.2 Member Typedef Documentation

4.881.2.1 `template<typename _RealType = double> typedef _RealType std::piecewise_constant_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 5484 of file `random.h`.

4.881.3 Member Function Documentation

4.881.3.1 `template<typename _RealType = double> std::vector<double> std::piecewise_constant_distribution< _RealType >::densities () const [inline]`

Returns a vector of the probability densities.

Definition at line 5602 of file `random.h`.

References `std::vector< _Tp, _Alloc >::empty()`.

4.881.3.2 `template<typename _RealType = double> std::vector<_RealType> std::piecewise_constant_distribution< _RealType >::intervals () const [inline]`

Returns a vector of the intervals.

Definition at line 5586 of file `random.h`.

References `std::vector< _Tp, _Alloc >::empty()`.

4.881.3.3 `template<typename _RealType = double> result_type std::piecewise_constant_distribution< _RealType >::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 5637 of file `random.h`.

References `std::vector< _Tp, _Alloc >::back()`, and `std::vector< _Tp, _Alloc >::empty()`.

4.881.3.4 `template<typename _RealType = double> result_type std::piecewise_constant_distribution< _RealType >::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 5627 of file `random.h`.

References `std::vector< _Tp, _Alloc >::empty()`, and `std::vector< _Tp, _Alloc >::front()`.

4.881.3.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type
std::piecewise_constant_distribution<_RealType>::operator()(_UniformRandomNumberGenerator & __urng)
[inline]`

Generating functions.

Definition at line 5648 of file random.h.

4.881.3.6 `template<typename _RealType = double> param_type std::piecewise_constant_distribution<_RealType
>::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 5612 of file random.h.

4.881.3.7 `template<typename _RealType = double> void std::piecewise_constant_distribution<_RealType>::param (
const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5620 of file random.h.

4.881.3.8 `template<typename _RealType = double> void std::piecewise_constant_distribution<_RealType>::reset ()
[inline]`

Resets the distribution state.

Definition at line 5579 of file random.h.

4.881.4 Friends And Related Function Documentation

4.881.4.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits>
std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const
std::piecewise_constant_distribution<_RealType1> & __x) [friend]`

Inserts a piecewise_constant_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A piecewise_constant_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.881.4.2 `template<typename _RealType = double> bool operator==(const piecewise_constant_distribution<_RealType
> & __d1, const piecewise_constant_distribution<_RealType> & __d2) [friend]`

Return true if two piecewise constant distributions have the same parameters.

Definition at line 5683 of file random.h.

4.881.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits
> std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is,
std::piecewise_constant_distribution<_RealType1> & __x) [friend]`

Extracts a `piecewise_constant_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_constant_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.884.1 Detailed Description

template<typename `_RealType` = double>class `std::piecewise_linear_distribution<_RealType>`

A `piecewise_linear_distribution` random number distribution.

The formula for the piecewise linear probability mass function is

Definition at line 5748 of file `random.h`.

4.884.2 Member Typedef Documentation

4.884.2.1 template<typename `_RealType` = double> typedef `_RealType` `std::piecewise_linear_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 5751 of file `random.h`.

4.884.3 Member Function Documentation

4.884.3.1 template<typename `_RealType` = double> `std::vector<double>` `std::piecewise_linear_distribution<_RealType>::densities ()` const [inline]

Return a vector of the probability densities of the distribution.

Definition at line 5872 of file `random.h`.

References `std::vector<_Tp, _Alloc>::empty()`.

4.884.3.2 template<typename `_RealType` = double> `std::vector<_RealType>` `std::piecewise_linear_distribution<_RealType>::intervals ()` const [inline]

Return the intervals of the distribution.

Definition at line 5855 of file `random.h`.

References `std::vector<_Tp, _Alloc>::empty()`.

4.884.3.3 `template<typename _RealType = double> result_type std::piecewise_linear_distribution<_RealType>::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 5907 of file random.h.

References `std::vector<_Tp, _Alloc>::back()`, and `std::vector<_Tp, _Alloc>::empty()`.

4.884.3.4 `template<typename _RealType = double> result_type std::piecewise_linear_distribution<_RealType>::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 5897 of file random.h.

References `std::vector<_Tp, _Alloc>::empty()`, and `std::vector<_Tp, _Alloc>::front()`.

4.884.3.5 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator> result_type std::piecewise_linear_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 5918 of file random.h.

4.884.3.6 `template<typename _RealType = double> param_type std::piecewise_linear_distribution<_RealType>::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 5882 of file random.h.

4.884.3.7 `template<typename _RealType = double> void std::piecewise_linear_distribution<_RealType>::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5890 of file random.h.

4.884.3.8 `template<typename _RealType = double> void std::piecewise_linear_distribution<_RealType>::reset () [inline]`

Resets the distribution state.

Definition at line 5848 of file random.h.

4.884.4 Friends And Related Function Documentation

4.884.4.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::piecewise_linear_distribution<_RealType1> & __x) [friend]`

Inserts a `piecewise_linear_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.884.4.2 `template<typename _RealType = double> bool operator==(const piecewise_linear_distribution<_RealType> & __d1, const piecewise_linear_distribution<_RealType> & __d2) [friend]`

Return true if two piecewise linear distributions have the same parameters.

Definition at line 5953 of file `random.h`.

4.884.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::piecewise_linear_distribution<_RealType1> & __x) [friend]`

Extracts a `piecewise_linear_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.891.1 Detailed Description

```
template<typename _IntType = int>class std::poisson_distribution< _IntType >
```

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$ where μ is the parameter of the distribution.

Definition at line 4430 of file random.h.

4.891.2 Member Typedef Documentation

4.891.2.1 `template<typename _IntType = int> typedef _IntType std::poisson_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 4433 of file random.h.

4.891.3 Member Function Documentation

4.891.3.1 `template<typename _IntType = int> result_type std::poisson_distribution< _IntType >::max () const`
`[inline]`

Returns the least upper bound value of the distribution.

Definition at line 4524 of file random.h.

References `std::numeric_limits< _Tp >::max()`.

4.891.3.2 `template<typename _IntType = int> double std::poisson_distribution< _IntType >::mean () const` `[inline]`

Returns the distribution parameter `mean`.

Definition at line 4495 of file random.h.

4.891.3.3 `template<typename _IntType = int> result_type std::poisson_distribution< _IntType >::min () const`
`[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4517 of file random.h.

4.891.3.4 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > poisson_distribution<_IntType>::result_type std::poisson_distribution<_IntType>::operator() (_UniformRandomNumberGenerator & __urng, const param_type & __param)`

A rejection algorithm when mean ≥ 12 and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_TR1` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

Definition at line 1436 of file `bits/random.tcc`.

References `std::abs()`, `std::numeric_limits<_Tp>::epsilon()`, `std::log()`, and `std::numeric_limits<_Tp>::max()`.

4.891.3.5 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type std::poisson_distribution<_IntType>::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 4532 of file `random.h`.

4.891.3.6 `template<typename _IntType = int> param_type std::poisson_distribution<_IntType>::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 4502 of file `random.h`.

4.891.3.7 `template<typename _IntType = int> void std::poisson_distribution<_IntType>::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4510 of file `random.h`.

4.891.3.8 `template<typename _IntType = int> void std::poisson_distribution<_IntType>::reset () [inline]`

Resets the distribution state.

Definition at line 4488 of file `random.h`.

References `std::normal_distribution<_RealType>::reset()`.

4.891.4 Friends And Related Function Documentation

4.891.4.1 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::poisson_distribution<_IntType1> & __x) [friend]`

Inserts a `poisson_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A poisson_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.891.4.2 `template<typename _IntType = int> bool operator==(const poisson_distribution< _IntType > &__d1, const poisson_distribution< _IntType > &__d2) [friend]`

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4568 of file random.h.

4.891.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_istream< _CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > &__is, std::poisson_distribution< _IntType1 > &__x) [friend]`

Extracts a poisson_distribution random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A poisson_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.893.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_-  
type>>class std::priority_queue<_Tp, _Sequence, _Compare >
```

A standard container automatically sorting its contents.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>vector<_Tp></code> .
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Sequence::value_type></code> .

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

Definition at line 367 of file `stl_queue.h`.

4.893.2 Constructor & Destructor Documentation

4.893.2.1 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue(const _Compare &__x, const _Sequence &__s) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 402 of file `stl_queue.h`.

References `std::make_heap()`.

4.893.2.2 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> template<typename _InputIterator > std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue(_InputIterator __first, _InputIterator __last, const _Compare &__x, const _Sequence &__s) [inline]`

Builds a queue from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	A comparison functor describing a strict weak ordering.

<code>__s</code>	An initial sequence with which to start.
------------------	--

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

Definition at line 442 of file `stl_queue.h`.

References `std::make_heap()`.

4.893.3 Member Function Documentation

4.893.3.1 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
_Sequence::value_type>> bool std::priority_queue<_Tp, _Sequence, _Compare >::empty () const
[inline]`

Returns true if the queue is empty.

Definition at line 468 of file `stl_queue.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.893.3.2 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
_Sequence::value_type>> void std::priority_queue<_Tp, _Sequence, _Compare >::pop () [inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 531 of file `stl_queue.h`.

References `std::pop_heap()`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.893.3.3 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
_Sequence::value_type>> void std::priority_queue<_Tp, _Sequence, _Compare >::push (const value_type & __x
) [inline]`

Add data to the queue.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Definition at line 496 of file `stl_queue.h`.

References `std::push_heap()`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.893.3.4 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
_Sequence::value_type>> size_type std::priority_queue<_Tp, _Sequence, _Compare >::size () const
[inline]`

Returns the number of elements in the queue.

Definition at line 473 of file `stl_queue.h`.

```
4.893.3.5 template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename
    _Sequence::value_type>> const_reference std::priority_queue<_Tp, _Sequence, _Compare>::top ( ) const
    [inline]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 481 of file `stl_queue.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.894.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>> class std::queue< _Tp, _Sequence >
```

A standard container giving FIFO behavior.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque<_Tp></code> .

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push` and `pop`, which are standard queue/FIFO operations.

Definition at line 93 of file `stl_queue.h`.

4.894.2 Constructor & Destructor Documentation

```
4.894.2.1 template<typename _Tp, typename _Sequence = deque<_Tp>> std::queue< _Tp, _Sequence >::queue ( const
        _Sequence & __c ) [inline], [explicit]
```

Default constructor creates no elements.

Definition at line 138 of file `stl_queue.h`.

4.894.3 Member Function Documentation

```
4.894.3.1 template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::queue< _Tp, _Sequence >::back ( )
        [inline]
```

Returns a read/write reference to the data at the last element of the queue.

Definition at line 185 of file `stl_queue.h`.

References `std::queue< _Tp, _Sequence >::c`.

```
4.894.3.2 template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue< _Tp, _Sequence
        >::back ( ) const [inline]
```

Returns a read-only (constant) reference to the data at the last element of the queue.

Definition at line 196 of file `stl_queue.h`.

References `std::queue< _Tp, _Sequence >::c`.

```
4.894.3.3 template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::queue< _Tp, _Sequence >::front ( )
        [inline]
```

Returns a read/write reference to the data at the first element of the queue.

Definition at line 163 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.894.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue< _Tp, _Sequence >::front () const [inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 174 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.894.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue< _Tp, _Sequence >::pop () [inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 238 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.894.3.6 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue< _Tp, _Sequence >::push (const value_type &__x) [inline]`

Add data to the end of the queue.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 212 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.894.3.7 `template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::queue< _Tp, _Sequence >::size () const [inline]`

Returns the number of elements in the queue.

Definition at line 155 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.894.4 Member Data Documentation

4.894.4.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> _Sequence std::queue< _Tp, _Sequence >::c [protected]`

'c' is the underlying container. Maintainers wondering why this isn't uglified as per style guidelines should note that this name is specified in the standard, [23.2.3.1]. (Why? Presumably for the same reason that it's protected instead of private: to allow derivation. But none of the other containers allow for derivation. Odd.)

Definition at line 126 of file stl_queue.h.

Referenced by `std::queue< _Tp, _Sequence >::back()`, `std::queue< _Tp, _Sequence >::front()`, `std::operator==()`, `std::queue< _Tp, _Sequence >::pop()`, `std::queue< _Tp, _Sequence >::push()`, and `std::queue< _Tp, _Sequence >::size()`.

4.897 `std::range_error` Class Reference

Inheritance diagram for `std::range_error`:

Public Member Functions

- **range_error** (const [string](#) &__arg)
- virtual const char * **what** () const noexcept

4.897.1 Detailed Description

Thrown to indicate range errors in internal computations.

Definition at line 130 of file `stdexcept`.

4.897.2 Member Function Documentation

4.897.2.1 virtual const char* std::runtime_error::what () const [virtual],[noexcept],[inherited]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.898 std::ratio< _Num, _Den > Struct Template Reference

Public Types

- typedef [ratio](#)< num, den > **type**

Static Public Attributes

- static constexpr intmax_t **den**
- static constexpr intmax_t **num**

4.898.1 Detailed Description

```
template<intmax_t _Num, intmax_t _Den = 1>struct std::ratio< _Num, _Den >
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`. The ratio is simplified when instantiated.

For example:

```
*  std::ratio<7,-21>::num == -1;
*  std::ratio<7,-21>::den == 3;
*
```

Definition at line 263 of file `ratio`.

The documentation for this struct was generated from the following file:

- [raw_storage_iterator](#) & **[operator=](#)** (const [_Tp](#) &__element)

Protected Attributes

- [_OutputIterator](#) **[_M_iter](#)**

4.901.1 Detailed Description

```
template<class _OutputIterator, class _Tp>class std::raw_storage_iterator< _OutputIterator, _Tp >
```

This iterator class lets algorithms store their results into uninitialized memory.

Definition at line 68 of file `stl_raw_storage_iter.h`.

4.901.2 Member Typedef Documentation

4.901.2.1 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::difference_type` [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.901.2.2 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category` [inherited]

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.901.2.3 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer` [inherited]

This type represents a pointer-to-value_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.901.2.4 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::reference` [inherited]

This type represents a reference-to-value_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.901.2.5 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type` [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

The documentation for this class was generated from the following file:

- [stl_raw_storage_iter.h](#)

4.902 std::recursive_mutex Class Reference

::type **operator()** (_Args &&...__args) const
- [reference_wrapper](#) & **operator=** (const [reference_wrapper](#)< _Tp > &__inref) noexcept

4.903.1 Detailed Description

```
template<typename _Tp>class std::reference_wrapper< _Tp >
```

Primary class template for `reference_wrapper`.

Definition at line 399 of file `functional`.

The documentation for this class was generated from the following file:

- [functional](#)

4.904 std::regex_error Class Reference

Inheritance diagram for `std::regex_error`:

Public Member Functions

- [regex_error](#) ([regex_constants::error_type](#) __ecode)
- [regex_constants::error_type](#) code () const
- virtual const char * [what](#) () const noexcept

4.904.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Definition at line 135 of file `regex_error.h`.

4.904.2 Constructor & Destructor Documentation

4.904.2.1 `std::regex_error::regex_error(regex_constants::error_type __ecode)` [explicit]

Constructs a `regex_error` object.

Parameters

<code>__ecode</code>	the regex error code.
----------------------	-----------------------

4.904.3 Member Function Documentation

4.904.3.1 `regex_constants::error_type std::regex_error::code() const` `[inline]`

Gets the regex error code.

Returns

the regex error code.

Definition at line 156 of file `regex_error.h`.

4.904.3.2 `virtual const char* std::runtime_error::what() const` `[virtual]`, `[noexcept]`, `[inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from `std::exception`.

The documentation for this class was generated from the following file:

- [regex_error.h](#)

4.905 `std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>` Class Template Reference

Public Types

4.905.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Definition at line 2364 of file `regex.h`.

4.905.2 Constructor & Destructor Documentation

```
4.905.2.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( )
[inline]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Definition at line 2378 of file `regex.h`.

Referenced by `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator()`.

```
4.905.2.2 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator
( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, regex_constants::match_flag_type __m =
regex_constants::match_default ) [inline]
```

Constructs a `regex_iterator`...

Parameters

<code>__a</code>	[IN] The start of a text range to search.
<code>__b</code>	[IN] One-past-the-end of the text range to search.
<code>__re</code>	[IN] The regular expression to match.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2389 of file `regex.h`.

References `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator()`, and `std::regex_search()`.

```
4.905.2.3 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( const
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) [default]
```

Copy constructs a `regex_iterator`.

4.905.3 Member Function Documentation

```
4.905.3.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= ( const
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const [inline]
```

Tests the inequivalence of two `regex_iterator`s.

Definition at line 2419 of file `regex.h`.

4.905.3.2 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type& std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator* () const [inline]`

Dereferences a `regex_iterator`.

Definition at line 2426 of file `regex.h`.

4.905.3.3 `template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits> regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ()`

Increments a `regex_iterator`.

Definition at line 558 of file `regex.tcc`.

References `std::regex_constants::match_continuous`, `std::regex_constants::match_not_null`, `std::regex_constants::match_prev_avail`, and `std::regex_search()`.

4.905.3.4 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ (int) [inline]`

Postincrements a `regex_iterator`.

Definition at line 2446 of file `regex.h`.

4.905.3.5 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type* std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator-> () const [inline]`

Selects a `regex_iterator` member.

Definition at line 2433 of file `regex.h`.

4.905.3.6 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator& std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator= (const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs) [default]`

Assigns one `regex_iterator` to another.

4.905.3.7 `template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits> bool std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator== (const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs) const`

Tests the equivalence of two `regex` iterators.

Definition at line 543 of file `regex.tcc`.

References `std::match_results<_Bi_iter, _Alloc>::empty()`.

The documentation for this class was generated from the following files:

- [regex.h](#)
- [regex.tcc](#)

4.906.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a `std::sub_match` object.

Definition at line 2479 of file `regex.h`.

4.906.2 Constructor & Destructor Documentation

```
4.906.2.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ( ) [inline]
```

Default constructs a `regex_token_iterator`.

A default-constructed `regex_token_iterator` is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

Definition at line 2497 of file `regex.h`.

```
4.906.2.2  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::regex_token_iterator
           ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, int __submatch = 0, regex_constants::match_flag_type
           __m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatch</code>	[IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> • -1 each enumerated subexpression does NOT match the regular expression (aka field splitting) • 0 the entire string matching the subexpression is returned for each match within the text. • >0 enumerates only the indicated subexpression from a match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2519 of file regex.h.

```
4.906.2.3 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::regex_token_iterator
( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, const std::vector< int > & __submatches,
  regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2535 of file regex.h.

```
4.906.2.4 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
>::regex_token_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, initializer_list< int >
__submatches, regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2552 of file regex.h.

```
4.906.2.5 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> template<std::size_t _Nm> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
>::regex_token_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, const int(&) __submatches[_Nm],
  regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

Definition at line 2570 of file `regex.h`.

```
4.906.2.6  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::regex_token_iterator
           ( const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs ) [inline]
```

Copy constructs a `regex_token_iterator`.

Parameters

<code>__rhs</code>	[IN] A <code>regex_token_iterator</code> to copy.
--------------------	---

Definition at line 2583 of file `regex.h`.

4.906.3 Member Function Documentation

```
4.906.3.1  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> bool std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator!=( const
           regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs ) const [inline]
```

Compares a `regex_token_iterator` to another for inequality.

Definition at line 2609 of file `regex.h`.

```
4.906.3.2  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> const value_type& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
           >::operator*( ) const [inline]
```

Dereferences a `regex_token_iterator`.

Definition at line 2616 of file `regex.h`.

```
4.906.3.3  template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits> regex_token_iterator<_Bi_iter, _Ch_type,
           _Rx_traits> & std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++( )
```

Increments a `regex_token_iterator`.

Definition at line 651 of file `regex.tcc`.

```
4.906.3.4  template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
           = regex_traits<_Ch_type>> regex_token_iterator std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
           >::operator++( int ) [inline]
```

Postincrements a `regex_token_iterator`.

Definition at line 2636 of file `regex.h`.

```
4.906.3.5 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> const value_type* std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits
>::operator-> ( ) const [inline]
```

Selects a regex_token_iterator member.

Definition at line 2623 of file regex.h.

```
4.906.3.6 template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits > regex_token_iterator<_Bi_iter,
_Ch_type, _Rx_traits > & std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits >::operator= ( const
regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

Assigns a regex_token_iterator to another.

Parameters

<code>__rhs</code>	[IN] A regex_token_iterator to copy.
--------------------	--------------------------------------

Definition at line 613 of file regex.tcc.

```
4.906.3.7 template<typename _Bi_iter, typename _Ch_type, typename _Rx_traits > bool std::regex_token_iterator<_Bi_iter,
_Ch_type, _Rx_traits >::operator==( const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const
```

Compares a regex_token_iterator to another for equality.

Definition at line 631 of file regex.tcc.

4.907.1 Detailed Description

`template<typename _Ch_type>struct std::regex_traits< _Ch_type >`

Class `regex_traits`. Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Definition at line 72 of file `regex.h`.

4.907.2 Constructor & Destructor Documentation

4.907.2.1 `template<typename _Ch_type> std::regex_traits< _Ch_type >::regex_traits () [inline]`

Constructs a default traits object.

Definition at line 152 of file `regex.h`.

4.907.3 Member Function Documentation

4.907.3.1 `template<typename _Ch_type> locale_type std::regex_traits< _Ch_type >::getloc () const [inline]`

Gets a copy of the current locale in use by the `regex_traits` object.

Definition at line 365 of file `regex.h`.

4.907.3.2 `template<typename _Ch_type> locale_type std::regex_traits< _Ch_type >::imbue (locale_type __loc) [inline]`

Imbues the `regex_traits` object with a copy of a new locale.

Parameters

<code>__loc</code>	A locale.
--------------------	-----------

Returns

a copy of the previous locale in use by the regex_traits object.

Note

Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this.

Definition at line 354 of file regex.h.

References std::swap().

4.907.3.3 `template<typename _Ch_type> bool std::regex_traits<_Ch_type>::isctype (_Ch_type __c, char_class_type __f) const`

Determines if `c` is a member of an identified class.

Parameters

<code>__c</code>	a character.
<code>__f</code>	a class type (as returned from lookup_classname).

Returns

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

Exceptions

<code>std::bad_cast</code>	if the current locale does not have a ctype facet.
----------------------------	--

Definition at line 382 of file regex.tcc.

4.907.3.4 `template<typename _Ch_type> static std::size_t std::regex_traits<_Ch_type>::length (const char_type * __p) [inline], [static]`

Gives the length of a C-style string starting at `__p`.

Parameters

<code>__p</code>	a pointer to the start of a character sequence.
------------------	---

Returns

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 165 of file regex.h.

4.907.3.5 `template<typename _Ch_type> template<typename _Fwd_iter> char_class_type std::regex_traits<_Ch_type>::lookup_classname (_Fwd_iter __first, _Fwd_iter __last, bool __icase = false) const`

Maps one or more characters to a named character classification.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.
<code>__icase</code>	ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[:lower:]` is the same as `[:alpha:]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower
- print
- punct
- space
- upper
- xdigit

4.907.3.6 `template<typename _Ch_type> template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::lookup_collatename (_Fwd_iter __first, _Fwd_iter __last) const`

Gets a collation element by name.

Parameters

<code>__first</code>	beginning of the collation element name.
<code>__last</code>	one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[__first, __last)`. Returns an empty string if the character sequence is not a valid collating element.

```
4.907.3.7  template<typename _Ch_type> template<typename _Fwd_iter > string_type std::regex_traits<_Ch_type>::transform ( _Fwd_iter __first, _Fwd_iter __last ) const  [inline]
```

Gets a sort key for a character sequence.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then `v.transform(G1, G2) < v.transform(H1, H2)`.

What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

<code>std::bad_cast</code>	if the current locale does not have a collate facet.
----------------------------	--

Definition at line 218 of file `regex.h`.

References `std::basic_string< _CharT, _Traits, _Alloc >::data()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

Referenced by `std::regex_traits< _Ch_type >::transform_primary()`.

4.907.3.8 `template<typename _Ch_type> template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::transform_primary (_Fwd_iter __first, _Fwd_iter __last) const [inline]`

Gets a sort key for a character sequence, independent of case.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Effects: if `typeid(use_facet<collate<_Ch_type> >) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo Implement this function correctly.

Definition at line 242 of file `regex.h`.

References `std::vector< _Tp, _Alloc >::data()`, `std::vector< _Tp, _Alloc >::size()`, and `std::regex_traits< _Ch_type >::transform()`.

4.907.3.9 `template<typename _Ch_type> char_type std::regex_traits< _Ch_type >::translate (char_type __c) const [inline]`

Performs the identity translation.

Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---

Returns

`__c`.

Definition at line 176 of file `regex.h`.

```
4.907.3.10 template<typename _Ch_type> char_type std::regex_traits<_Ch_type>::translate_nocase ( char_type __c ) const  
           [inline]
```

Translates a character into a case-insensitive equivalent.

Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---

Returns

the locale-specific lower-case equivalent of `__c`.

Exceptions

<code>std::bad_cast</code>	if the imbued locale does not support the ctype facet.
----------------------------	--

Definition at line 189 of file `regex.h`.

4.907.3.11 `template<typename _Ch_type> int std::regex_traits<_Ch_type>::value (_Ch_type __ch, int __radix) const`

Converts a digit to an int.

Parameters

<code>__ch</code>	a character representing a digit.
<code>__radix</code>	the radix if the numeric conversion (limited to 8, 10, or 16).

Returns

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

Definition at line 400 of file `regex.tcc`.

References `std::basic_ios<_CharT, _Traits>::fail()`, `std::hex()`, and `std::oct()`.

4.908.1 Detailed Description

```
template<typename _Iterator> class std::reverse_iterator<_Iterator>
```

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
*      &*(reverse_iterator(i)) == &(i - 1)
*
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 97 of file `stl_iterator.h`.

4.908.2 Member Typedef Documentation

```
4.908.2.1  typedef iterator_traits<_Iterator>::iterator_category std::iterator< iterator_traits<_Iterator>
           >::iterator_category, iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type,
           iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::iterator_category  [inherited]
```

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

```
4.908.2.2  typedef iterator_traits<_Iterator>::value_type std::iterator< iterator_traits<_Iterator>::iterator_category
           , iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type, iterator_traits<_Iterator>
           >::pointer, iterator_traits<_Iterator>::reference>::value_type  [inherited]
```

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

4.908.3 Constructor & Destructor Documentation

```
4.908.3.1  template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator ( )  [inline]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Definition at line 121 of file `stl_iterator.h`.

Referenced by `std::reverse_iterator<_Iterator>::operator+()`, and `std::reverse_iterator<_Iterator>::operator-()`.

```
4.908.3.2  template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator ( iterator_type __x )
           [inline], [explicit]
```

This iterator will move in the opposite direction that `x` does.

Definition at line 127 of file `stl_iterator.h`.

```
4.908.3.3  template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator ( const reverse_iterator<
           _Iterator> &__x )  [inline]
```

The copy constructor is normal.

Definition at line 132 of file `stl_iterator.h`.

```
4.908.3.4  template<typename _Iterator> template<typename _Iter> std::reverse_iterator<_Iterator>::reverse_iterator (
           const reverse_iterator<_Iter> &__x )  [inline]
```

A `reverse_iterator` across other types can be copied if the underlying iterator can be converted to the type of `current`.

Definition at line 140 of file `stl_iterator.h`.

4.908.4 Member Function Documentation

4.908.4.1 `template<typename _Iterator> iterator_type std::reverse_iterator<_Iterator>::base () const [inline]`

Returns

`current`, the iterator used for underlying work.

Definition at line 147 of file `stl_iterator.h`.

Referenced by `std::operator==()`.

4.908.4.2 `template<typename _Iterator> reference std::reverse_iterator<_Iterator>::operator* () const [inline]`

Returns

A reference to the value at `-current`

This requires that `-current` is dereferenceable.

Warning

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

Definition at line 161 of file `stl_iterator.h`.

Referenced by `std::reverse_iterator<_Iterator>::operator->()`.

4.908.4.3 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator+ (difference_type __n) const [inline]`

Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 232 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::reverse_iterator()`.

4.908.4.4 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator++ () [inline]`

Returns

`*this`

Decrements the underlying iterator.

Definition at line 182 of file `stl_iterator.h`.

4.908.4.5 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator++ (int) [inline]`

Returns

The original value of `*this`

Decrements the underlying iterator.

Definition at line 194 of file `stl_iterator.h`.

4.908.4.6 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator+=(difference_type __n) [inline]`

Returns

*this

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

Definition at line 242 of file `stl_iterator.h`.

4.908.4.7 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator-(difference_type __n) const [inline]`

Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 254 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::reverse_iterator()`.

4.908.4.8 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator-- () [inline]`

Returns

*this

Increments the underlying iterator.

Definition at line 207 of file `stl_iterator.h`.

4.908.4.9 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator-- (int) [inline]`

Returns

A `reverse_iterator` with the previous value of *this

Increments the underlying iterator.

Definition at line 219 of file `stl_iterator.h`.

4.908.4.10 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator+=(difference_type __n) [inline]`

Returns

*this

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

Definition at line 264 of file `stl_iterator.h`.

4.908.4.11 `template<typename _Iterator> pointer std::reverse_iterator<_Iterator>::operator-> () const [inline]`

Returns

A pointer to the value at `-current`

This requires that `-current` is dereferenceable.

Definition at line 173 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::operator*()`.

4.908.4.12 `template<typename _Iterator> reference std::reverse_iterator<_Iterator>::operator[] (difference_type __n) const [inline]`

Returns

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

Definition at line 276 of file `stl_iterator.h`.

The documentation for this class was generated from the following file:

- [stl_iterator.h](#)

4.909 std::runtime_error Class Reference

Inheritance diagram for `std::runtime_error`:

**Public Member Functions**

- `runtime_error` (const `string` &__arg)
- virtual const char * `what` () const noexcept

4.909.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

Definition at line 112 of file stdexcept.

4.909.2 Constructor & Destructor Documentation

4.909.2.1 `std::runtime_error::runtime_error (const string &__arg) [explicit]`

Takes a character string describing the error.

4.909.3 Member Function Documentation

4.909.3.1 `virtual const char* std::runtime_error::what () const [virtual], [noexcept]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.912.1 Detailed Description

`template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> class std::set< _Key, _Compare, _Alloc >`

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

Definition at line 90 of file `stl_set.h`.

4.912.3 Constructor & Destructor Documentation

```
4.912.3.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
        std::set<_Key, _Compare, _Alloc>::set ( ) [inline]
```

Default constructor creates no elements.

Definition at line 142 of file stl_set.h.

```
4.912.3.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
        std::set<_Key, _Compare, _Alloc>::set ( const _Compare & __comp, const allocator_type & __a =
        allocator_type ( ) ) [inline], [explicit]
```

Creates a set with no elements.

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

Definition at line 151 of file stl_set.h.

```
4.912.3.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
        template<typename _InputIterator > std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator
        __last ) [inline]
```

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a set consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

Definition at line 166 of file stl_set.h.

```
4.912.3.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
        template<typename _InputIterator > std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator
        __last, const _Compare & __comp, const allocator_type & __a = allocator_type ( ) ) [inline]
```

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first,__last)`).

Definition at line 183 of file `stl_set.h`.

```
4.912.3.5  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( const set<_Key, _Compare, _Alloc> & __x )  [inline]
```

Set copy constructor.

Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The newly-created set uses a copy of the allocation object used by `__x`.

Definition at line 196 of file `stl_set.h`.

```
4.912.3.6  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( initializer_list<value_type> & __l, const _Compare & __comp =
            _Compare(), const allocator_type & __a = allocator_type() )  [inline]
```

Builds a set from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 221 of file `stl_set.h`.

```
4.912.3.7  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( const allocator_type & __a )  [inline], [explicit]
```

Allocator-extended default constructor.

Definition at line 229 of file `stl_set.h`.

```
4.912.3.8  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( const set<_Key, _Compare, _Alloc> & __x, const allocator_type & __a
            )  [inline]
```

Allocator-extended copy constructor.

Definition at line 233 of file `stl_set.h`.

```
4.912.3.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( initializer_list<value_type> & __l, const allocator_type & __a )
            [inline]
```

Allocator-extended initialier-list constructor.

Definition at line 243 of file stl_set.h.

```
4.912.3.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator> std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator
__last, const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

Definition at line 249 of file stl_set.h.

4.912.4 Member Function Documentation

```
4.912.4.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::set<_Key, _Compare, _Alloc>::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 333 of file stl_set.h.

```
4.912.4.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::set<_Key, _Compare, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 370 of file stl_set.h.

```
4.912.4.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::set<_Key, _Compare, _Alloc>::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 379 of file stl_set.h.

```
4.912.4.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::set<_Key, _Compare, _Alloc>::clear ( ) [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 668 of file stl_set.h.

Referenced by std::set<_StateIdT>::operator=().

```
4.912.4.5 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set<_Key, _Compare, _Alloc>::count ( const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>__x</code>	Element to located.
------------------	---------------------

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 682 of file `stl_set.h`.

```
4.912.4.6  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
           reverse_iterator std::set<_Key, _Compare, _Alloc>::crbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 388 of file `stl_set.h`.

```
4.912.4.7  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
           reverse_iterator std::set<_Key, _Compare, _Alloc>::crend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 397 of file `stl_set.h`.

```
4.912.4.8  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
           template<typename... _Args> std::pair<iterator, bool> std::set<_Key, _Compare, _Alloc>::emplace ( _Args
           &&... _args )  [inline]
```

Attempts to build and insert an element into the set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 451 of file `stl_set.h`.

```
4.912.4.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
           template<typename... _Args> iterator std::set<_Key, _Compare, _Alloc>::emplace_hint ( const_iterator __pos,
           _Args &&... _args )  [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 477 of file `stl_set.h`.

```
4.912.4.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool
std::set<_Key, _Compare, _Alloc>::empty ( ) const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 403 of file `stl_set.h`.

```
4.912.4.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 342 of file `stl_set.h`.

```
4.912.4.12 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<iterator, iterator> std::set<_Key, _Compare, _Alloc>::equal_range ( const key_type & __x )
[inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
* std::make_pair(c.lower_bound(val),
*               c.upper_bound(val))
*
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 762 of file `stl_set.h`.

```
4.912.4.13 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<const_iterator, const_iterator> std::set<_Key, _Compare, _Alloc>::equal_range ( const
key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
*   std::make_pair(c.lower_bound(val),
*                   c.upper_bound(val))
*
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 766 of file `stl_set.h`.

```
4.912.4.14  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
              _GLIBCXX_ABI_TAG_CXX11 iterator std::set<_Key, _Compare, _Alloc>::erase ( const_iterator __position )
              [inline]
```

Erases an element from a set.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 589 of file `stl_set.h`.

```
4.912.4.15  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
              size_type std::set<_Key, _Compare, _Alloc>::erase ( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 619 of file `stl_set.h`.

4.912.4.16 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set<_Key, _Compare, _Alloc>::erase (const_iterator __first,
const_iterator __last) [inline]`

Erases a [`__first`,`__last`) range of elements from a set.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 641 of file `stl_set.h`.

```
4.912.4.17  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            iterator std::set<_Key, _Compare, _Alloc>::find ( const key_type & __x ) [inline]
```

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 700 of file `stl_set.h`.

```
4.912.4.18  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            const_iterator std::set<_Key, _Compare, _Alloc>::find ( const key_type & __x ) const [inline]
```

Tries to locate an element in a set.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 704 of file `stl_set.h`.

```
4.912.4.19  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            allocator_type std::set<_Key, _Compare, _Alloc>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

Definition at line 324 of file `stl_set.h`.

```
4.912.4.20  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
            std::pair<iterator, bool> std::set<_Key, _Compare, _Alloc>::insert( const value_type &__x ) [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 498 of file `stl_set.h`.

Referenced by `std::set<_StateldT>::insert()`, and `std::set<_StateldT>::operator=()`.

```
4.912.4.21  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            iterator std::set<_Key, _Compare, _Alloc>::insert ( const_iterator __position, const value_type & __x )
            [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 535 of file `stl_set.h`.

```
4.912.4.22  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > void std::set<_Key, _Compare, _Alloc>::insert ( _InputIterator __first,
            _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 555 of file `stl_set.h`.

```
4.912.4.23  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void  
            std::set<_Key, _Compare, _Alloc>::insert( initializer_list<value_type> __l ) [inline]
```

Attempts to insert a list of elements into the set.

Parameters

<code>__l</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 567 of file `stl_set.h`.

4.912.4.24 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set<_Key, _Compare, _Alloc>::key_comp () const [inline]`

Returns the comparison object with which the set was constructed.

Definition at line 316 of file `stl_set.h`.

4.912.4.25 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::lower_bound (const key_type & __x) [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 721 of file `stl_set.h`.

4.912.4.26 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::lower_bound (const key_type & __x) const [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 725 of file `stl_set.h`.

4.912.4.27 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set<_Key, _Compare, _Alloc>::max_size () const [inline], [noexcept]`

Returns the maximum size of the set.

Definition at line 413 of file `stl_set.h`.

```
4.912.4.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::set<_Key, _Compare, _Alloc>::noexcept ( is_nothrow_copy_constructible<_Compare>::value )
    [inline]
```

Set move constructor

Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The newly-created set contains the exact contents of `x`. The contents of `x` are a valid, but unspecified set.

Definition at line 208 of file `stl_set.h`.

```
4.912.4.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::noexcept ( is_nothrow_copy_constructible<_Compare>::value
&&_Alloc_traits::_S_always_equal() ) [inline]
```

Allocator-extended move constructor.

Definition at line 238 of file `stl_set.h`.

```
4.912.4.30 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
std::set<_Key, _Compare, _Alloc>::operator= ( const set<_Key, _Compare, _Alloc> &__x ) [inline]
```

Set assignment operator.

Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 263 of file `stl_set.h`.

```
4.912.4.31 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
std::set<_Key, _Compare, _Alloc>::operator= ( set<_Key, _Compare, _Alloc> &&__x ) [inline],
[noexcept]
```

Set move assignment operator.

Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this set (without copying). `__x` is a valid, but unspecified set.

Definition at line 278 of file `stl_set.h`.

```
4.912.4.32 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
std::set<_Key, _Compare, _Alloc>::operator= ( initializer_list<value_type> __l ) [inline]
```

Set list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 304 of file `stl_set.h`.

```
4.912.4.33 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set<_Key, _Compare, _Alloc>::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 351 of file stl_set.h.

4.912.4.34 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::set<_Key, _Compare, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 360 of file stl_set.h.

4.912.4.35 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set<_Key, _Compare, _Alloc>::size () const [inline], [noexcept]`

Returns the size of the set.

Definition at line 408 of file stl_set.h.

4.912.4.36 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::upper_bound (const key_type & __x) [inline]`

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 737 of file stl_set.h.

4.912.4.37 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::upper_bound (const key_type & __x) const [inline]`

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 741 of file stl_set.h.

4.912.4.38 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::set<_Key, _Compare, _Alloc>::value_comp () const [inline]`

Returns the comparison object with which the set was constructed.

Definition at line 320 of file stl_set.h.

4.912.5 Member Data Documentation

4.912.5.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::void`

Swaps data with another set.

Parameters

<code>__x</code>	A set of the same element and allocator types.
------------------	--

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 432 of file `stl_set.h`.

The documentation for this class was generated from the following file:

- [stl_set.h](#)

4.913.1 Detailed Description

`template<typename _Tp>class std::shared_ptr<_Tp>`

A smart pointer with reference-counted copy semantics.

The object pointed to is deleted when the last `shared_ptr` pointing to it is destroyed or reset.

Definition at line 93 of file `shared_ptr.h`.

4.913.2 Constructor & Destructor Documentation

4.913.2.1 `template<typename _Tp> constexpr std::shared_ptr<_Tp>::shared_ptr() [inline], [noexcept]`

Construct an empty `shared_ptr`.

Postcondition

`use_count()==0 && get()==0`

Definition at line 100 of file `shared_ptr.h`.

4.913.2.2 `template<typename _Tp> template<typename _Tp1 > std::shared_ptr<_Tp>::shared_ptr (_Tp1 * __p)`
`[inline], [explicit]`

Construct a `shared_ptr` that owns the pointer `__p`.

Parameters

<code>__p</code>	A pointer that is convertible to <code>element_type*</code> .
------------------	---

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

<code>std::bad_alloc</code> , <i>in</i>	which case <code>delete __p</code> is called.
---	---

Definition at line 112 of file `shared_ptr.h`.

4.913.2.3 `template<typename _Tp> template<typename _Tp1, typename _Deleter> std::shared_ptr<_Tp>::shared_ptr (_Tp1 * __p, _Deleter __d) [inline]`

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

Parameters

<code>__p</code>	A pointer.
<code>__d</code>	A deleter.

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

<code>std::bad_alloc</code> , <i>in</i>	which case <code>__d(__p)</code> is called.
---	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw

`__shared_ptr` will release `__p` by calling `__d(__p)`

Definition at line 129 of file `shared_ptr.h`.

4.913.2.4 `template<typename _Tp> template<typename _Deleter> std::shared_ptr<_Tp>::shared_ptr (nullptr_t __p, _Deleter __d) [inline]`

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

Parameters

<code>__p</code>	A null pointer constant.
<code>__d</code>	A deleter.

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

<code>std::bad_alloc</code> , <i>in</i>	which case <code>__d(__p)</code> is called.
---	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw

The last owner will call `__d(__p)`

Definition at line 146 of file `shared_ptr.h`.

4.913.2.5 `template<typename _Tp> template<typename _Tp1, typename _Deleter, typename _Alloc> std::shared_ptr<_Tp>::shared_ptr(_Tp1 * __p, _Deleter __d, _Alloc __a) [inline]`

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

Parameters

<code>__p</code>	A pointer.
<code>__d</code>	A deleter.
<code>__a</code>	An allocator.

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

<code>std::bad_alloc</code> , in	which case <code>__d(__p)</code> is called.
----------------------------------	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

`__shared_ptr` will release `__p` by calling `__d(__p)`

Definition at line 165 of file `shared_ptr.h`.

4.913.2.6 `template<typename _Tp> template<typename _Deleter, typename _Alloc > std::shared_ptr<_Tp>::shared_ptr (nullptr_t __p, _Deleter __d, _Alloc __a) [inline]`

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

Parameters

<code>__p</code>	A null pointer constant.
<code>__d</code>	A deleter.
<code>__a</code>	An allocator.

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

<code>std::bad_alloc</code> , in	which case <code>__d(__p)</code> is called.
----------------------------------	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

The last owner will call `__d(__p)`

Definition at line 184 of file `shared_ptr.h`.

4.913.2.7 `template<typename _Tp> template<typename _Tp1 > std::shared_ptr<_Tp>::shared_ptr (const shared_ptr<_Tp1> & __r, _Tp* __p) [inline], [noexcept]`

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

Parameters

<code>__r</code>	A <code>shared_ptr</code> .
<code>__p</code>	A pointer that will remain valid while <code>*__r</code> is valid.

Postcondition

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`.

```
* shared_ptr< pair<int,int> > pii(new pair<int,int>());
* shared_ptr<int> pi(pii, &pii->first);
* assert(pii.use_count() == 2);
*
```

Definition at line 206 of file `shared_ptr.h`.

4.913.2.8 `template<typename _Tp> template<typename _Tp1, typename = typename std::enable_if<std::is_convertible<_Tp1*, _Tp*>::value>::type> std::shared_ptr< _Tp >::shared_ptr (const shared_ptr< _Tp1 > & __r)` `[inline]`, `[noexcept]`

If `__r` is empty, constructs an empty `shared_ptr`; otherwise construct a `shared_ptr` that shares ownership with `__r`.

Parameters

<code>__r</code>	A <code>shared_ptr</code> .
------------------	-----------------------------

Postcondition

```
get() == __r.get() && use_count() == __r.use_count()
```

Definition at line 218 of file `shared_ptr.h`.

4.913.2.9 `template<typename _Tp> std::shared_ptr< _Tp >::shared_ptr (shared_ptr< _Tp > && __r)` `[inline]`, `[noexcept]`

Move-constructs a `shared_ptr` instance from `__r`.

Parameters

<code>__r</code>	A <code>shared_ptr</code> rvalue.
------------------	-----------------------------------

Postcondition

```
*this contains the old value of __r, __r is empty.
```

Definition at line 226 of file `shared_ptr.h`.

4.913.2.10 `template<typename _Tp> template<typename _Tp1, typename = typename std::enable_if<std::is_convertible<_Tp1*, _Tp*>::value>::type> std::shared_ptr< _Tp >::shared_ptr (shared_ptr< _Tp1 > && __r)` `[inline]`, `[noexcept]`

Move-constructs a `shared_ptr` instance from `__r`.

Parameters

<code>__r</code>	A <code>shared_ptr</code> rvalue.
------------------	-----------------------------------

Postcondition

```
*this contains the old value of __r, __r is empty.
```

Definition at line 236 of file `shared_ptr.h`.

4.913.2.11 `template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr(const weak_ptr< _Tp1 > &__r) [inline], [explicit]`

Constructs a `shared_ptr` that shares ownership with `__r` and stores a copy of the pointer stored in `__r`.

Parameters

<code>__r</code>	A weak_ptr.
------------------	-------------

Postcondition

`use_count() == __r.use_count()`

Exceptions

<i>bad_weak_ptr</i>	when <code>__r.expired()</code> , in which case the constructor has no effect.
---------------------	--

Definition at line 248 of file `shared_ptr.h`.

4.913.2.12 `template<typename _Tp> constexpr std::shared_ptr< _Tp >::shared_ptr (nullptr_t __p) [inline],
[noexcept]`

Construct an empty `shared_ptr`.

Parameters

<code>__p</code>	A null pointer constant.
------------------	--------------------------

Postcondition

`use_count() == 0 && get() == nullptr`

Definition at line 265 of file `shared_ptr.h`.

4.913.3 Friends And Related Function Documentation

4.913.3.1 `template<typename _Tp> template<typename _Tp1, typename _Alloc, typename... _Args> shared_ptr<_Tp1>
allocate_shared (const _Alloc & __a, _Args &&... __args) [friend]`

Create an object that is owned by a `shared_ptr`.

Parameters

<code>__a</code>	An allocator.
<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.

Returns

A `shared_ptr` that owns the newly created object.

Exceptions

<i>An</i>	exception thrown from <code>_Alloc::allocate</code> or from the constructor of <code>_Tp</code> .
-----------	---

A copy of `__a` will be used to allocate memory for the `shared_ptr` and the new object.

Definition at line 595 of file `shared_ptr.h`.

4.914.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __k> class std::shuffle_order_engine< _RandomNumberEngine, __k >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1292 of file random.h.

4.914.2 Member Typedef Documentation

```
4.914.2.1 template<typename _RandomNumberEngine, size_t __k> typedef _RandomNumberEngine::result_type
std::shuffle_order_engine< _RandomNumberEngine, __k >::result_type
```

The type of the generated random value.

Definition at line 1295 of file random.h.

4.914.3 Constructor & Destructor Documentation

```
4.914.3.1 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,
__k >::shuffle_order_engine ( ) [inline]
```

Constructs a default shuffle_order_engine engine.

The underlying engine is default constructed as well.

Definition at line 1308 of file random.h.

```
4.914.3.2 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,
__k >::shuffle_order_engine ( const _RandomNumberEngine & __rng ) [inline],[explicit]
```

Copy constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1319 of file random.h.

```
4.914.3.3 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,
__k >::shuffle_order_engine ( _RandomNumberEngine && __rng ) [inline],[explicit]
```

Move constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1330 of file random.h.

```
4.914.3.4 template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,
__k >::shuffle_order_engine ( result_type __s ) [inline],[explicit]
```

Seed constructs a shuffle_order_engine engine.

Constructs the underlying generator engine seeded with __s.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 1341 of file random.h.

```
4.914.3.5 template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq, typename =
typename std::enable_if<!std::is_same<_Sseq, shuffle_order_engine>::value && !std::is_same<_Sseq,
_RandomNumberEngine>::value> ::type> std::shuffle_order_engine<_RandomNumberEngine, __k
>::shuffle_order_engine ( _Sseq & __q ) [inline], [explicit]
```

Generator construct a shuffle_order_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 1355 of file random.h.

4.914.4 Member Function Documentation

```
4.914.4.1 template<typename _RandomNumberEngine, size_t __k> const _RandomNumberEngine&
std::shuffle_order_engine<_RandomNumberEngine, __k>::base ( ) const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

Definition at line 1398 of file random.h.

```
4.914.4.2 template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine<
_RandomNumberEngine, __k>::discard ( unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

Definition at line 1419 of file random.h.

```
4.914.4.3 template<typename _RandomNumberEngine, size_t __k> static constexpr result_type
std::shuffle_order_engine<_RandomNumberEngine, __k>::max ( ) [inline], [static]
```

Gets the maximum value in the generated random number range.

Definition at line 1412 of file random.h.

References std::max().

```
4.914.4.4 template<typename _RandomNumberEngine, size_t __k> static constexpr result_type
std::shuffle_order_engine<_RandomNumberEngine, __k>::min ( ) [inline], [static]
```

Gets the minimum value in the generated random number range.

Definition at line 1405 of file random.h.

References std::min().

```
4.914.4.5 template<typename _RandomNumberEngine, size_t __k> shuffle_order_engine<_RandomNumberEngine, __k
>::result_type std::shuffle_order_engine<_RandomNumberEngine, __k>::operator() ( )
```

Gets the next value in the generated random number sequence.

Definition at line 818 of file bits/random.tcc.

4.914.4.6 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine<_RandomNumberEngine, __k>::seed () [inline]`

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1364 of file `random.h`.

4.914.4.7 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine<_RandomNumberEngine, __k>::seed (result_type __s) [inline]`

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1375 of file `random.h`.

4.914.4.8 `template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq > void std::shuffle_order_engine<_RandomNumberEngine, __k>::seed (_Sseq & __q) [inline]`

Reseeds the `shuffle_order_engine` object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 1388 of file `random.h`.

4.914.5 Friends And Related Function Documentation

4.914.5.1 `template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const std::shuffle_order_engine<_RandomNumberEngine1, __k1> & __x) [friend]`

Inserts the current state of a `shuffle_order_engine` random number generator engine `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>shuffle_order_engine</code> random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.914.5.2 `template<typename _RandomNumberEngine, size_t __k> bool operator== (const shuffle_order_engine<_RandomNumberEngine, __k> & __lhs, const shuffle_order_engine<_RandomNumberEngine, __k> & __rhs) [friend]`

Compares two `shuffle_order_engine` random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A <code>shuffle_order_engine</code> random number generator object.
<code>__rhs</code>	Another <code>shuffle_order_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1443 of file `random.h`.

```
4.914.5.3 template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1 ,
size_t __k1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (
std::basic_istream<_CharT, _Traits > & __is, std::shuffle_order_engine<_RandomNumberEngine1, __k1 > &
__x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A shuffle_order_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

- [slice](#) ()
- [slice](#) (size_t __o, size_t __d, size_t __s)
- size_t [size](#) () const
- size_t [start](#) () const
- size_t [stride](#) () const

4.915.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

Definition at line 59 of file slice_array.h.

The documentation for this class was generated from the following file:

Friends

- class `valarray<_Tp>`

4.916.1 Detailed Description

```
template<class _Tp>class std::slice_array<_Tp>
```

Reference to one-dimensional subset of an array.

A `slice_array` is a reference to the actual elements of an array specified by a slice. The way to get a `slice_array` is to call `operator[]`(slice) on a `valarray`. The returned `slice_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`. For example, `operator+=(valarray)` will add values to the subset of elements in the underlying `valarray` this `slice_array` refers to.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 80 of file `valarray`.

The documentation for this class was generated from the following files:

4.917.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>class std::stack< _Tp, _Sequence >
```

A standard container giving FILO behavior.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque<_Tp></code> .

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_front`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

Definition at line 96 of file `stl_stack.h`.

4.917.2 Constructor & Destructor Documentation

4.917.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> std::stack<_Tp, _Sequence>::stack (const _Sequence &__c) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 134 of file `stl_stack.h`.

4.917.3 Member Function Documentation

4.917.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack<_Tp, _Sequence>::pop () [inline]`

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 212 of file `stl_stack.h`.

4.917.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack<_Tp, _Sequence>::push (const value_type &__x) [inline]`

Add data to the top of the stack.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 186 of file `stl_stack.h`.

4.917.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::stack<_Tp, _Sequence>::size () const [inline]`

Returns the number of elements in the stack.

Definition at line 151 of file `stl_stack.h`.

4.917.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::stack<_Tp, _Sequence>::top ()`
`[inline]`

Returns a read/write reference to the data at the first element of the stack.

Definition at line 159 of file `stl_stack.h`.

4.917.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::stack<_Tp, _Sequence>::top`
`() const [inline]`

Returns a read-only (constant) reference to the data at the first element of the stack.

Definition at line 170 of file `stl_stack.h`.

4.918.4 Friends And Related Function Documentation

4.918.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits>`
`std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & __os, const`
`std::student_t_distribution<_RealType1> & __x) [friend]`

Inserts a `student_t_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>student_t_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.918.4.2 `template<typename _RealType = double> bool operator==(const student_t_distribution<_RealType> & __d1, const student_t_distribution<_RealType> & __d2) [friend]`

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3494 of file `random.h`.

4.918.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream<_CharT, _Traits> & __is, std::student_t_distribution<_RealType1> & __x) [friend]`

Extracts a `student_t_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>student_t_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

4.920.1 Detailed Description

```
template<typename _Bilter> class std::sub_match<_Bilter >
```

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with `std::basic_string` objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Definition at line 788 of file `regex.h`.

4.920.2 Member Typedef Documentation

4.920.2.1 `typedef _Bilter std::pair<_Bilter, _Bilter>::second_type` [\[inherited\]](#)

`first_type` is the first bound type

Definition at line 99 of file `stl_pair.h`.

4.920.3 Member Function Documentation

4.920.3.1 `template<typename _Bilter> int std::sub_match<_Bilter>::compare (const sub_match<_Bilter> & __s) const` [\[inline\]](#)

Compares this and another matched sequence.

Parameters

<code>__s</code>	Another matched sequence to compare to this one.
------------------	--

Return values

<code>< 0</code>	this matched sequence will collate before <code>__s</code> .
<code>= 0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>> 0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 849 of file `regex.h`.

Referenced by `std::operator!=()`, `std::operator<()`, `std::operator<=()`, `std::operator==()`, `std::operator>()`, and `std::operator>=()`.

4.920.3.2 `template<typename _Bilter> int std::sub_match<_Bilter>::compare (const string_type & __s) const` [\[inline\]](#)

Compares this `sub_match` to a string.

Parameters

<code>__s</code>	A string to compare to this <code>sub_match</code> .
------------------	--

Return values

<code><0</code>	this matched sequence will collate before <code>__s</code> .
<code>=0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>>0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 862 of file `regex.h`.

4.920.3.3 `template<typename _Biliter> int std::sub_match<_Biliter>::compare (const value_type * __s) const`
`[inline]`

Compares this `sub_match` to a C-style string.

Parameters

<code>__s</code>	A C-style string to compare to this <code>sub_match</code> .
------------------	--

Return values

<code><0</code>	this matched sequence will collate before <code>__s</code> .
<code>=0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>>0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 875 of file `regex.h`.

4.920.3.4 `template<typename _Biliter> difference_type std::sub_match<_Biliter>::length () const` `[inline]`

Gets the length of the matching sequence.

Definition at line 806 of file `regex.h`.

4.920.3.5 `template<typename _Biliter> std::sub_match<_Biliter>::operator string_type () const` `[inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the `str()` member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

Definition at line 819 of file `regex.h`.

4.920.3.6 `template<typename _Biliter> string_type std::sub_match<_Biliter>::str () const` `[inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

Definition at line 832 of file `regex.h`.

Referenced by `std::sub_match<_Bi_iter>::compare()`, and `std::operator<<()`.

4.925.1 Detailed Description

```
template<typename _CharT, typename _InIter> class std::time_get<_CharT, _InIter>
```

Primary class template `time_get`.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The `time_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_get` facet.

Definition at line 368 of file `locale_facets_nonio.h`.

4.925.3 Constructor & Destructor Documentation

4.925.3.1 template<typename _CharT, typename _InIter> std::time_get<_CharT, _InIter>::time_get(size_t __refs = 0)
[inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 390 of file locale_facets_nonio.h.

4.925.3.2 template<typename _CharT, typename _InIter> virtual std::time_get<_CharT, _InIter>::~time_get()
[inline], [protected], [virtual]

Destructor.

Definition at line 546 of file locale_facets_nonio.h.

4.925.4 Member Function Documentation

4.925.4.1 template<typename _CharT, typename _InIter> dateorder std::time_get<_CharT, _InIter>::date_order() const
[inline]

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format x given to time_put::put() only uses month, day, and year. If the format x for the associated locale uses other fields, this function returns timebase::dateorder::noorder.

NOTE: The library always returns noorder at the moment.

Returns

A member of timebase::dateorder.

Definition at line 407 of file locale_facets_nonio.h.

References std::time_get<_CharT, _InIter>::do_date_order().

4.925.4.2 template<typename _CharT, typename _InIter> time_base::dateorder std::time_get<_CharT, _InIter>::do_date_order() const [protected], [virtual]

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format x given to time_put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of `timebase::dateorder`.

Definition at line 620 of file `locale_facets_nonio.tcc`.

Referenced by `std::time_get<_CharT, _InIter>::date_order()`.

```
4.925.4.3 template<typename _CharT, typename _InIter> _InIter std::time_get<_CharT, _InIter>::do_get_date( iter_type
    __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const    [protected],
    [virtual]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See Also

`get_date()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <code>tm</code> to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1047 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_date()`.

```
4.925.4.4 template<typename _CharT, typename _InIter> _InIter std::time_get<_CharT, _InIter>::do_get_monthname
    ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
    [protected], [virtual]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See Also

`get_monthname()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1092 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get< _CharT, _Inlter >::get_monthname()`.

4.925.4.5 `template<typename _CharT, typename _Inlter > _Inlter std::time_get< _CharT, _Inlter >::do_get_time (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` `[protected]`, `[virtual]`

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

`get_time()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1030 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get< _CharT, _Inlter >::get_time()`.

4.925.4.6 `template<typename _CharT, typename _Inlter > _Inlter std::time_get< _CharT, _Inlter >::do_get_weekday (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` `[protected]`, `[virtual]`

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

`get_weekday()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1064 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_weekday()`.

4.925.4.7 `template<typename _CharT, typename _InIter> _InIter std::time_get<_CharT, _InIter>::do_get_year (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [protected], [virtual]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

`get_year()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1120 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_year()`.

4.925.4.8 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_date (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 456 of file locale_facets_nonio.h.

References `std::time_get< _CharT, _InIter >::do_get_date()`.

4.925.4.9 `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_monthname (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 513 of file locale_facets_nonio.h.

References `std::time_get< _CharT, _InIter >::do_get_monthname()`.

4.925.4.10 `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_time (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 431 of file locale_facets_nonio.h.

References `std::time_get<_CharT, _InIter>::do_get_time()`.

4.925.4.11 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_weekday (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file locale_facets_nonio.h.

References `std::time_get<_CharT, _InIter>::do_get_weekday()`.

4.925.4.12 `template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_year (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

4.926.1 Detailed Description

```
template<typename _CharT, typename _InIter>class std::time_get_byname<_CharT, _InIter>
```

class time_get_byname [22.2.5.2].

Definition at line 686 of file locale_facets_nonio.h.

4.926.2 Member Function Documentation

4.926.2.1 `template<typename _CharT, typename _InIter> dateorder std::time_get<_CharT, _InIter>::date_order () const`
`[inline], [inherited]`

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format x given to time_put::put() only uses month, day, and year. If the format x for the associated locale uses other fields, this function returns timebase::dateorder::noorder.

NOTE: The library always returns noorder at the moment.

Returns

A member of timebase::dateorder.

Definition at line 407 of file locale_facets_nonio.h.

References std::time_get<_CharT, _InIter>::do_date_order().

4.926.2.2 `template<typename _CharT, typename _InIter> time_base::dateorder std::time_get<_CharT, _InIter>::do_date_order () const`
`[protected], [virtual], [inherited]`

Return preferred order of month, day, and year.

This function returns an enum from timebase::dateorder giving the preferred ordering if the format x given to time_put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of timebase::dateorder.

Definition at line 620 of file locale_facets_nonio.tcc.

Referenced by std::time_get<_CharT, _InIter>::date_order().

4.926.2.3 `template<typename _CharT, typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_date (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` `[protected]`, `[virtual]`, `[inherited]`

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See Also

`get_date()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <code>tm</code> to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1047 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_date()`.

4.926.2.4 `template<typename _CharT, typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_monthname (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` `[protected]`, `[virtual]`, `[inherited]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See Also

`get_monthname()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <code>tm</code> to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1092 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_monthname()`.

4.926.2.5 `template<typename _CharT, typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_time (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` [protected], [virtual], [inherited]

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See Also

`get_time()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1030 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_time()`.

4.926.2.6 `template<typename _CharT, typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_weekday (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` [protected], [virtual], [inherited]

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See Also

`get_weekday()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1064 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_weekday()`.

4.926.2.7 `template<typename _CharT, typename _InIter > _InIter std::time_get< _CharT, _InIter >::do_get_year (iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` `[protected]`,
`[virtual]`, `[inherited]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See Also

`get_year()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1120 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

Referenced by `std::time_get< _CharT, _InIter >::get_year()`.

4.926.2.8 `template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_date (iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const` `[inline]`,
`[inherited]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err != ios_base::failbit`. If parsing reads all the characters, `err != ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 456 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _InIter >::do_get_date()`.

4.926.2.9 `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_monthname (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline], [inherited]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 513 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _InIter >::do_get_monthname()`.

4.926.2.10 `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_time (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm) const [inline], [inherited]`

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 431 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _InIter >::do_get_time()`.

```
4.926.2.11 template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_weekday
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[inline], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _InIter >::do_get_weekday()`.

```
4.926.2.12 template<typename _CharT, typename _InIter > iter_type std::time_get< _CharT, _InIter >::get_year ( iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline],
[inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 539 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _InIter >::do_get_year()`.

4.926.3 Member Data Documentation

4.927.1 Detailed Description

`template<typename _CharT, typename _Outiter> class std::time_put<_CharT, _Outiter>`

Primary class template `time_put`.

This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`.

The `time_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `time_put` facet.

Definition at line 715 of file `locale_facets_nonio.h`.

4.927.2 Member Typedef Documentation

4.927.3 Constructor & Destructor Documentation

4.927.3.1 `template<typename _CharT, typename _Outiter> std::time_put<_CharT, _Outiter>::time_put(size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 736 of file `locale_facets_nonio.h`.

4.927.3.2 `template<typename _CharT, typename _Outlter > virtual std::time_put< _CharT, _Outlter >::~time_put ()`
`[inline], [protected], [virtual]`

Destructor.

Definition at line 782 of file `locale_facets_nonio.h`.

4.927.4 Member Function Documentation

4.927.4.1 `template<typename _CharT, typename _Outlter > _Outlter std::time_put< _CharT, _Outlter >::do_put (iter_type`
`__s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod) const` `[protected],`
`[virtual]`

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See Also

`put()` for more details.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

Definition at line 1178 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

Referenced by `std::time_put< _CharT, _Outlter >::put()`.

4.927.4.2 `template<typename _CharT, typename _Outlter > _Outlter std::time_put< _CharT, _Outlter >::put (iter_type __s,`
`ios_base & __io, char_type __fill, const tm * __tm, const _CharT * __beg, const _CharT * __end) const`

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format string. The format string is interpreted as by `strftime()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

Returns

Iterator after writing.

Definition at line 1143 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base< _CharT >::narrow()`.

4.927.4.3 `template<typename _CharT, typename _Outlter> iter_type std::time_put< _CharT, _Outlter >::put (iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod = 0) const [inline]`

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format char and optional modifier. The format and modifier are interpreted as by `strftime()`. It does so by returning `time_put::do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

Definition at line 775 of file `locale_facets_nonio.h`.

References `std::time_put< _CharT, _Outlter >::do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

Definition at line 1178 of file locale_facets_nonio.tcc.

References std::ios_base::M_getloc(), and std::__ctype_abstract_base<_CharT>::widen().

Referenced by std::time_put<_CharT, _Outlter>::put().

4.928.2.2 template<typename _CharT, typename _Outlter>_Outlter std::time_put<_CharT, _Outlter>::put (iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, const _CharT * __beg, const _CharT * __end) const [inherited]

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

Returns

Iterator after writing.

Definition at line 1143 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base<_CharT>::narrow()`.

4.928.2.3 `template<typename _CharT, typename _Outlter> iter_type std::time_put<_CharT, _Outlter>::put(iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod = 0) const` `[inline]`, `[inherited]`

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format char and optional modifier. The format and modifier are interpreted as by `strftime()`. It does so by returning `time_put::do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

Definition at line 775 of file `locale_facets_nonio.h`.

References `std::time_put<_CharT, _Outlter>::do_put()`.

4.934.1 Detailed Description

`bool_set`

See N2136, `Bool_set`: multi-valued logic by Hervnnimann, Guillaume Melquiond, Sylvain Pion.

The implicit conversion to `bool` is slippery! I may use the new explicit conversion. This has been specialized in the language so that in contexts requiring a `bool` the conversion happens implicitly. Thus most objections should be eliminated.

Definition at line 54 of file `bool_set`.

4.934.2 Constructor & Destructor Documentation

4.936.1 Detailed Description

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> class std::tr2::dynamic_bitset< _WordT, _Alloc >
```

The `dynamic_bitset` class represents a sequence of bits.

(Note that `dynamic_bitset` does *not* meet the formal requirements of a `container`. Mainly, it lacks iterators.)

The template argument, *Nb*, may be any non-negative number, specifying the number of bits (e.g., "0", "12", "1024*1024").

In the general unoptimized case, storage is allocated in word-sized blocks. Let *B* be the number of bits in a word, then $(Nb+(B-1))/B$ words will be used for storage. *B* - *NbB* bits are unused. (They are the high-order bits in the highest word.) It is a class invariant that those unused bits are always zero.

If you think of `dynamic_bitset` as "a simple array of bits," be aware that your mental picture is reversed: a `dynamic_bitset` behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and the bit at index *Nb*-1 in the "most significant / left-hand" position. Thus, unlike other containers, a `dynamic_bitset`'s index "counts from right to left," to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
* #include <dynamic_bitset>
* #include <iostream>
* #include <sstream>
*
* using namespace std;
*
* int main()
* {
*     long a = 'a';
*     dynamic_bitset b(a);
*
*     cout << "b('a') is " << b << endl;
*
*     ostringstream s;
*     s << b;
*     string str = s.str();
*     cout << "index 3 in the string is " << str[3] << " but\n"
*          << "index 3 in the bitset is " << b[3] << endl;
* }
*
```

Also see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt12ch33s02.html> for a description of extensions.

Most of the actual code isn't contained in `dynamic_bitset<>` itself, but in the base class `__dynamic_bitset_base`. The base class works with whole words, not with individual bits. This allows us to specialize `__dynamic_bitset_base` for the important special case where the `dynamic_bitset` is only a single word.

Extra confusion can result due to the fact that the storage for `__dynamic_bitset_base` is a vector, and is indexed as such. This is carefully encapsulated.

Definition at line 440 of file `dynamic_bitset`.

4.936.2 Constructor & Destructor Documentation

```
4.936.2.1 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset ( size_type __nbits, unsigned long long __val =
0ULL, const allocator_type & __alloc = allocator_type() ) [inline], [explicit]
```

Initial bits bitwise-copied from a single word (others set to zero).

Definition at line 607 of file dynamic_bitset.

```
4.936.2.2 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> template<typename
_CharT, typename _Traits, typename _Alloc1 > std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset
( const std::basic_string< _CharT, _Traits, _Alloc1 > & __str, typename basic_string< _CharT, _Traits,
_Alloc1 >::size_type __pos = 0, typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __n =
std::basic_string<_CharT, _Traits, _Alloc1>::npos, _CharT __zero = _CharT('0'),
_CharT __one = _CharT('1'), const allocator_type & __alloc = allocator_type() ) [inline],
[explicit]
```

Use a subset of a string.

Parameters

<code>__str</code>	A string of '0' and '1' characters.
<code>__pos</code>	Index of the first character in <code>__str</code> to use.
<code>__n</code>	The number of characters to copy.

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of <code>__str</code> .
<code>std::invalid_argument</code>	If a character appears in the string which is neither '0' nor '1'.

Definition at line 629 of file dynamic_bitset.

References `std::tr2::dynamic_bitset< _WordT, _Alloc >::resize()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

```
4.936.2.3 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset ( const char * __str, const allocator_type & __alloc
= allocator_type() ) [inline], [explicit]
```

Construct from a string.

Parameters

<code>__str</code>	A string of '0' and '1' characters.
--------------------	-------------------------------------

Exceptions

<code>std::invalid_argument</code>	If a character appears in the string which is neither '0' nor '1'.
------------------------------------	--

Definition at line 657 of file dynamic_bitset.

```
4.936.2.5 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset ( dynamic_bitset< _WordT, _Alloc > && __b )
[inline]
```

Move constructor.

Definition at line 680 of file `dynamic_bitset`.

4.936.3 Member Function Documentation

4.936.3.1 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool
std::tr2::dynamic_bitset<_WordT, _Alloc>::all () const [inline]`

Tests whether all the bits are on.

Returns

True if all the bits are set.

Definition at line 1069 of file `dynamic_bitset`.

4.936.3.2 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool
std::tr2::dynamic_bitset<_WordT, _Alloc>::any () const [inline]`

Tests whether any of the bits are on.

Returns

True if at least one bit is set.

Definition at line 1077 of file `dynamic_bitset`.

4.936.3.3 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void
std::tr2::dynamic_bitset<_WordT, _Alloc>::append (block_type __block) [inline]`

Append a block.

Definition at line 763 of file `dynamic_bitset`.

Referenced by `std::tr2::dynamic_bitset<_WordT, _Alloc>::append()`.

4.936.3.4 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> template<typename
_BlockInputIterator > void std::tr2::dynamic_bitset<_WordT, _Alloc>::append (_BlockInputIterator __first,
_BlockInputIterator __last) [inline]`

Append an iterator range of blocks.

Definition at line 781 of file `dynamic_bitset`.

References `std::tr2::dynamic_bitset<_WordT, _Alloc>::append()`.

4.936.3.5 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void
std::tr2::dynamic_bitset<_WordT, _Alloc>::clear () [inline]`

Clear the bitset.

Definition at line 741 of file `dynamic_bitset`.

4.936.3.6 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::count () const [inline], [noexcept]`

Returns the number of bits which are set.

Definition at line 1025 of file `dynamic_bitset`.

4.936.3.7 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool
std::tr2::dynamic_bitset<_WordT, _Alloc>::empty () const [inline], [noexcept]`

Returns true if the dynamic_bitset is empty.

Definition at line 1040 of file dynamic_bitset.

4.936.3.8 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::find_first () const [inline]`

Finds the index of the first "on" bit.

Returns

The index of the first bit set, or size() if not found.

See Also

find_next

Definition at line 1105 of file dynamic_bitset.

4.936.3.9 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::find_next (size_t __prev) const [inline]`

Finds the index of the next "on" bit after prev.

Returns

The index of the next bit set, or size() if not found.

Parameters

<code>__prev</code>	Where to start searching.
---------------------	---------------------------

See Also

find_first

Definition at line 1115 of file dynamic_bitset.

4.936.3.10 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::flip () [inline]`

Toggles every bit to its opposite value.

Definition at line 920 of file dynamic_bitset.

Referenced by std::tr2::dynamic_bitset<_WordT, _Alloc>::operator~().

4.936.3.11 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::flip (size_type __pos)
[inline]`

Toggles a given bit to its opposite value.

Parameters

<code>__pos</code>	The index of the bit.
--------------------	-----------------------

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	--

Definition at line 933 of file `dynamic_bitset`.

4.936.3.12 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> allocator_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::get_allocator() const [inline]`

Return the allocator for the bitset.

Definition at line 721 of file `dynamic_bitset`.

4.936.3.13 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> constexpr size_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::max_size() [inline],[noexcept]`

Returns the maximum size of a `dynamic_bitset` object having the same type as `*this`. The real answer is `max() * bits_per_block` but is likely to overflow.

Definition at line 1047 of file `dynamic_bitset`.

References `std::numeric_limits<_Tp>::max()`.

4.936.3.14 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool
std::tr2::dynamic_bitset<_WordT, _Alloc>::none() const [inline]`

Tests whether any of the bits are on.

Returns

True if none of the bits are set.

Definition at line 1085 of file `dynamic_bitset`.

4.936.3.15 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::num_blocks() const [inline],[noexcept]`

Returns the total number of blocks.

Definition at line 1035 of file `dynamic_bitset`.

4.936.3.16 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc> & std::tr2::dynamic_bitset<_WordT, _Alloc>::operator&= (const
dynamic_bitset<_WordT, _Alloc> & __rhs) [inline]`

Operations on `dynamic_bitsets`.

Parameters

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--

These should be self-explanatory.

Definition at line 796 of file `dynamic_bitset`.

```
4.936.3.17 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
    dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc >::operator&= (
        dynamic_bitset<_WordT, _Alloc > &&__rhs ) [inline]
```

Operations on `dynamic_bitsets`.

Parameters

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--

These should be self-explanatory.

Definition at line 803 of file `dynamic_bitset`.

```
4.936.3.18 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::operator=( const
dynamic_bitset<_WordT, _Alloc> & __rhs ) [inline]
```

Operations on `dynamic_bitsets`.

Parameters

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--

These should be self-explanatory.

Definition at line 824 of file `dynamic_bitset`.

```
4.936.3.19 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>

) const [inline]
```

Self-explanatory.

Definition at line 1095 of file dynamic_bitset.

```
4.936.3.24 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::operator>= ( size_type
__pos ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__pos</code>	The number of places to shift.
--------------------	--------------------------------

These should be self-explanatory.

Definition at line 852 of file dynamic_bitset.

```
4.936.3.25 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> reference
std::tr2::dynamic_bitset<_WordT, _Alloc>::operator[] ( size_type __pos ) [inline]
```

Array-indexing support.

Parameters

<code>__pos</code>	Index into the dynamic_bitset.
--------------------	--------------------------------

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

Definition at line 955 of file dynamic_bitset.

```
4.936.3.26 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> const_reference
std::tr2::dynamic_bitset<_WordT, _Alloc>::operator[] ( size_type __pos ) const [inline]
```

Array-indexing support.

Parameters

<code>__pos</code>	Index into the dynamic_bitset.
--------------------	--------------------------------

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

Definition at line 959 of file dynamic_bitset.

```
4.936.3.27  template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
             dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::operator^= ( const
             dynamic_bitset<_WordT, _Alloc> &__rhs )  [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--

These should be self-explanatory.

Definition at line 817 of file `dynamic_bitset`.

```
4.936.3.28 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::operator|=( const
dynamic_bitset<_WordT, _Alloc> & __rhs ) [inline]
```

Operations on `dynamic_bitsets`.

Parameters

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--

These should be self-explanatory.

Definition at line 810 of file `dynamic_bitset`.

```
4.936.3.29 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc> std::tr2::dynamic_bitset<_WordT, _Alloc>::operator~( ) const
[inline]
```

See the no-argument `flip()`.

Definition at line 942 of file `dynamic_bitset`.

References `std::tr2::dynamic_bitset<_WordT, _Alloc>::flip()`.

```
4.936.3.30 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void
std::tr2::dynamic_bitset<_WordT, _Alloc>::push_back( bool __bit ) [inline]
```

Push a bit onto the high end of the bitset.

Definition at line 751 of file `dynamic_bitset`.

References `std::tr2::dynamic_bitset<_WordT, _Alloc>::size()`.

```
4.936.3.31 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::reset( ) [inline]
```

Sets every bit to false.

Definition at line 895 of file `dynamic_bitset`.

```
4.936.3.32 template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::reset( size_type __pos )
[inline]
```

Sets a given bit to false.

Parameters

<code>__pos</code>	The index of the bit.
--------------------	-----------------------

Exceptions

<i>std::out_of_range</i>	If <i>__pos</i> is bigger the size of the set.
--------------------------	--

Same as writing `set (__pos, false)`.

Definition at line 909 of file `dynamic_bitset`.

4.936.3.33 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void
std::tr2::dynamic_bitset<_WordT, _Alloc>::resize (size_type __nbits, bool __value = false) [inline]`

Resize the bitset.

Definition at line 728 of file `dynamic_bitset`.

Referenced by `std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset()`.

4.936.3.34 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::set () [inline]`

Sets every bit to true.

Definition at line 870 of file `dynamic_bitset`.

4.936.3.35 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset<_WordT, _Alloc>& std::tr2::dynamic_bitset<_WordT, _Alloc>::set (size_type __pos, bool
__val=true) [inline]`

Sets a given bit to a particular value.

Parameters

<i>__pos</i>	The index of the bit.
<i>__val</i>	Either true or false, defaults to true.

Exceptions

<i>std::out_of_range</i>	If <i>__pos</i> is bigger the size of the set.
--------------------------	--

Definition at line 884 of file `dynamic_bitset`.

4.936.3.36 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> size_type
std::tr2::dynamic_bitset<_WordT, _Alloc>::size () const [inline], [noexcept]`

Returns the total number of bits.

Definition at line 1030 of file `dynamic_bitset`.

Referenced by `std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back()`.

4.936.3.37 `template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> void
std::tr2::dynamic_bitset<_WordT, _Alloc>::swap (dynamic_bitset<_WordT, _Alloc> &__b) [inline]`

Swap with another bitset.

Definition at line 688 of file `dynamic_bitset`.

References `std::swap()`.

Referenced by `std::tr2::dynamic_bitset< _WordT, _Alloc >::operator=()`.

```
4.936.3.38  template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> bool  
            std::tr2::dynamic_bitset<_WordT, _Alloc >::test ( size_type __pos ) const  [inline]
```

Tests the value of a bit.

Parameters

<code>__pos</code>	The index of a bit.
--------------------	---------------------

Returns

The value at `__pos`.

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	--

Definition at line 1057 of file `dynamic_bitset`.

```
4.936.3.39  template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> template<typename
            _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 = std::allocator<_CharT>>>
            std::basic_string<_CharT, _Traits, _Alloc1> std::tr2::dynamic_bitset<_WordT, _Alloc>::to_string ( _CharT
            __zero = _CharT('0'), _CharT __one = _CharT('1') ) const  [inline]
```

Returns a character interpretation of the `dynamic_bitset`.

Returns

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

Definition at line 995 of file `dynamic_bitset`.

```
4.936.3.40  template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> unsigned long long
            std::tr2::dynamic_bitset<_WordT, _Alloc>::to_ullong ( ) const  [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

Returns

The integral equivalent of the bits.

Exceptions

<code>std::overflow_error</code>	If there are too many bits to be represented in an unsigned long.
----------------------------------	---

Definition at line 980 of file `dynamic_bitset`.

```
4.936.3.41  template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>> unsigned long
            std::tr2::dynamic_bitset<_WordT, _Alloc>::to_ulong ( ) const  [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

Returns

The integral equivalent of the bits.

Exceptions

<code>std::overflow_error</code>	If there are too many bits to be represented in an unsigned long.
----------------------------------	---

Definition at line 970 of file `dynamic_bitset`.

4.937.1 Detailed Description

`template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>class std::tr2::dynamic_bitset<_WordT, _Alloc>::reference`

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)

Definition at line 534 of file `dynamic_bitset`.

4.940.1 Detailed Description

`template<typename _T1, typename _T2>class std::tuple< _T1, _T2 >`

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.

Definition at line 521 of file tuple.

The documentation for this class was generated from the following file:

- [tuple](#)

4.941 `std::tuple_element<_Int,_Tp>` Class Template Reference

4.941.1 Detailed Description

```
template<std::size_t _Int, typename _Tp>class std::tuple_element<_Int,_Tp>
```

`tuple_element`

Gives the type of the *ith* element of a given tuple type.

Definition at line 315 of file array.

The documentation for this class was generated from the following file:

- [array](#)

4.942 `std::tuple_element<0,tuple<_Head,_Tail...>>` Struct Template Reference

Public Types

- typedef `_Head` **type**

4.942.1 Detailed Description

```
template<typename _Head, typename... _Tail>struct std::tuple_element<0,tuple<_Head,_Tail...>>
```

Basis case for `tuple_element`: The first element is the one we're seeking.

Definition at line 687 of file tuple.

The documentation for this struct was generated from the following file:

- [tuple](#)

4.943 `std::tuple_element< __i, tuple< _Head, _Tail...> >` Struct Template Reference

Inheritance diagram for `std::tuple_element< __i, tuple< _Head, _Tail...> >`:

4.943.1 Detailed Description

```
template<std::size_t __i, typename _Head, typename... _Tail>struct std::tuple_element< __i, tuple< _Head, _Tail...> >
```

Recursive case for `tuple_element`: strip off the first element in the tuple and retrieve the (i-1)th element of the remaining tuple.

Definition at line 680 of file `tuple`.

The documentation for this struct was generated from the following file:

- [tuple](#)

4.944 `std::tuple_size< _Tp >` Class Template Reference

4.944.1 Detailed Description

```
template<typename _Tp>class std::tuple_size< _Tp >
```

`tuple_size`

Finds the size of a given tuple type.

Definition at line 307 of file `array`.

The documentation for this class was generated from the following file:

- [array](#)

4.945 `std::tuple_size< tuple< _Elements...> >` Struct Template Reference

Inheritance diagram for `std::tuple_size< tuple< _Elements...> >`:

Public Types

- typedef [integral_constant](#) `< std::size_t, __v > type`
- typedef `std::size_t value_type`

Public Member Functions

- constexpr **operator value_type** () const

Static Public Attributes

- static constexpr `std::size_t value`

4.945.1 Detailed Description

```
template<typename... _Elements>struct std::tuple_size< tuple< _Elements...> >
```

```
class tuple_size
```

Definition at line 737 of file `tuple`.

The documentation for this struct was generated from the following file:

- [tuple](#)

4.946 `std::type_index` Struct Reference

Public Member Functions

- **type_index** (const [type_info](#) &__rhs) noexcept

- `size_t hash_code ()` const noexcept
- `const char * name ()` const noexcept
- `bool operator!= (const type_index &__rhs)` const noexcept

- `bool operator== (const type_index &__rhs)` const noexcept
- `bool operator> (const type_index &__rhs)` const noexcept
- `bool operator>= (const type_index &__rhs)` const noexcept

4.946.1 Detailed Description

Class `type_index`

The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (23.6) and in unordered associative containers (23.7).

Definition at line 52 of file `typeidindex`.

The documentation for this struct was generated from the following file:

- [typeidindex](#)

4.947 `std::type_info` Class Reference

Inherited by `__cxxabiv1::__array_type_info`, `__cxxabiv1::__class_type_info`, `__cxxabiv1::__enum_type_info`, `__cxxabiv1::__function_type_info`, `__cxxabiv1::__fundamental_type_info`, and `__cxxabiv1::__pbase_type_info`.

Public Member Functions

- virtual `~type_info ()`
- virtual `bool __do_catch (const type_info *__thr_type, void **__thr_obj, unsigned __outer)` const
- virtual `bool __do_upcast (const __cxxabiv1::__class_type_info *__target, void **__obj_ptr)` const

- `size_t hash_code ()` const noexcept
- `const char * name ()` const noexcept
- `bool operator!= (const type_info &__arg)` const noexcept
- `bool operator== (const type_info &__arg)` const noexcept

Protected Member Functions

- `type_info (const char * __n)`

Protected Attributes

- `const char * __name`

4.947.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

Definition at line 88 of file `typeinfo`.

4.947.2 Constructor & Destructor Documentation

4.947.2.1 `virtual std::type_info::~~type_info ()` `[virtual]`

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

4.947.3 Member Function Documentation

4.947.3.1 `const char* std::type_info::name () const` `[inline], [noexcept]`

Returns an *implementation-defined* byte string; this is not portable between compilers!

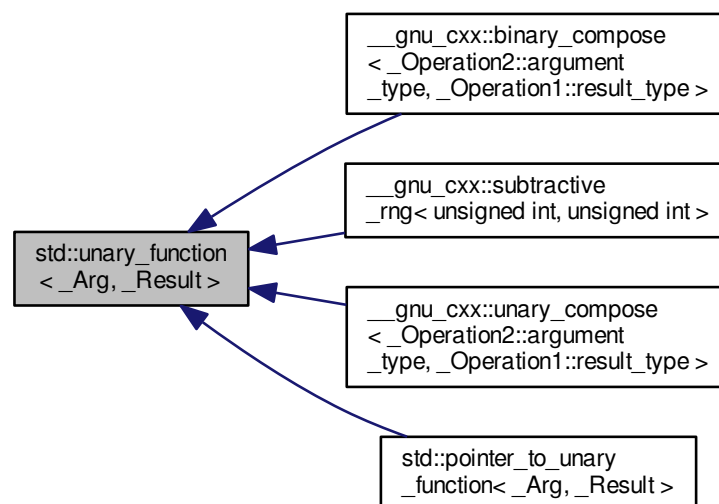

Definition at line 99 of file `typeinfo`.

The documentation for this class was generated from the following file:

- [typeinfo](#)

4.948 `std::unary_function< _Arg, _Result >` Struct Template Reference

Inheritance diagram for `std::unary_function< _Arg, _Result >`:

Public Types

- typedef `_Arg` [argument_type](#)
- typedef `_Result` [result_type](#)

4.948.1 Detailed Description

`template<typename _Arg, typename _Result> struct std::unary_function< _Arg, _Result >`

This is one of the [functor base classes](#).

Definition at line 105 of file `stl_function.h`.

4.948.2 Member Typedef Documentation

4.948.2.1 `template<typename _Arg, typename _Result> typedef _Arg std::unary_function< _Arg, _Result >::argument_type`

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

4.948.2.2 `template<typename _Arg, typename _Result> typedef _Result std::unary_function< _Arg, _Result >::result_type`

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl_function.h](#)

4.949 `std::unary_negate< _Predicate >` Class Template Reference

Inheritance diagram for `std::unary_negate< _Predicate >`:

Public Types

- typedef `_Predicate::argument_type` [argument_type](#)
- typedef `bool` [result_type](#)

Public Member Functions

- **`unary_negate`** (`const _Predicate &__x`)
- `bool` **`operator()`** (`const typename _Predicate::argument_type &__x`) `const`

Protected Attributes

- `_Predicate` **`_M_pred`**

4.949.1 Detailed Description

`template<typename _Predicate>class std::unary_negate<_Predicate>`

One of the [negation functors](#).

Definition at line 700 of file `stl_function.h`.

4.949.2 Member Typedef Documentation

4.949.2.1 `typedef _Predicate::argument_type std::unary_function<_Predicate::argument_type, bool>::argument_type` [\[inherited\]](#)

`argument_type` is the type of the argument

Definition at line 108 of file `stl_function.h`.

4.949.2.2 `typedef bool std::unary_function<_Predicate::argument_type, bool>::result_type` [\[inherited\]](#)

`result_type` is the return type

Definition at line 111 of file `stl_function.h`.

The documentation for this class was generated from the following file:

- [stl_function.h](#)

4.950 `std::underflow_error` Class Reference

Inheritance diagram for `std::underflow_error`:

Public Member Functions

- **`underflow_error`** (const [string](#) &__arg)
- virtual const char * [what](#) () const noexcept

4.950.1 Detailed Description

Thrown to indicate arithmetic underflow.

Definition at line 146 of file `stdexcept`.

4.950.2 Member Function Documentation

4.950.2.1 virtual const char* `std::runtime_error::what()` const [virtual], [noexcept], [inherited]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

4.951 `std::uniform_int_distribution<_IntType>` Class Template Reference

4.951.1 Detailed Description

`template<typename _IntType = int>class std::uniform_int_distribution<_IntType>`

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

Definition at line 1666 of file `random.h`.

4.951.2 Member Typedef Documentation

4.951.2.1 `template<typename _IntType = int> typedef _IntType std::uniform_int_distribution<_IntType>::result_type`

The type of the range of the distribution.

Definition at line 1669 of file `random.h`.

4.951.3 Constructor & Destructor Documentation

4.951.3.1 `template<typename _IntType = int> std::uniform_int_distribution< _IntType >::uniform_int_distribution (_IntType __a = 0, _IntType __b = std::numeric_limits<_IntType>::max()) [inline], [explicit]`

Constructs a uniform distribution object.

Definition at line 1709 of file random.h.

4.951.4 Member Function Documentation

4.951.4.1 `template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::max () const [inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1761 of file random.h.

4.951.4.2 `template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::min () const [inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1754 of file random.h.

4.951.4.3 `template<typename _IntType = int> template<typename UniformRandomNumberGenerator > result_type std::uniform_int_distribution< _IntType >::operator() (_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 1769 of file random.h.

4.951.4.4 `template<typename _IntType = int> param_type std::uniform_int_distribution< _IntType >::param () const [inline]`

Returns the parameter set of the distribution.

Definition at line 1739 of file random.h.

Referenced by `std::operator>>()`.

4.951.4.5 `template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 1747 of file random.h.

4.951.4.6 `template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::reset () [inline]`

Resets the distribution state.

Does nothing for the uniform integer distribution.

Definition at line 1725 of file random.h.

4.951.5 Friends And Related Function Documentation

4.951.5.1 `template<typename _IntType = int> bool operator== (const uniform_int_distribution<_IntType> &__d1, const uniform_int_distribution<_IntType> &__d2)` [*friend*]

Return true if two uniform integer distributions have the same parameters.

Definition at line 1804 of file `random.h`.

The documentation for this class was generated from the following files:

4.953.1 Detailed Description

template<typename `_RealType` = double>class std::uniform_real_distribution< `_RealType` >

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Definition at line 1867 of file random.h.

4.953.2 Member Typedef Documentation

4.953.2.1 template<typename `_RealType` = double> typedef `_RealType` std::uniform_real_distribution< `_RealType` >::`result_type`

The type of the range of the distribution.

Definition at line 1870 of file random.h.

4.953.3 Constructor & Destructor Documentation

4.953.3.1 `template<typename _RealType = double> std::uniform_real_distribution<_RealType>::uniform_real_distribution (_RealType __a = _RealType(0), _RealType __b = _RealType(1))`
`[inline], [explicit]`

Constructs a uniform_real_distribution object.

Parameters

<code>__a</code>	[IN] The lower bound of the distribution.
<code>__b</code>	[IN] The upper bound of the distribution.

Definition at line 1913 of file random.h.

4.953.4 Member Function Documentation

4.953.4.1 `template<typename _RealType = double> result_type std::uniform_real_distribution<_RealType>::max ()`
`const [inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1965 of file random.h.

4.953.4.2 `template<typename _RealType = double> result_type std::uniform_real_distribution<_RealType>::min ()`
`const [inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1958 of file random.h.

4.953.4.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type`
`std::uniform_real_distribution<_RealType>::operator() (_UniformRandomNumberGenerator & __urng)`
`[inline]`

Generating functions.

Definition at line 1973 of file random.h.

4.953.4.4 `template<typename _RealType = double> param_type std::uniform_real_distribution<_RealType>::param ()`
`const [inline]`

Returns the parameter set of the distribution.

Definition at line 1943 of file random.h.

Referenced by `std::operator>>()`.

4.953.4.5 `template<typename _RealType = double> void std::uniform_real_distribution<_RealType>::param (const`
`param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 1951 of file random.h.

4.953.4.6 `template<typename _RealType = double> void std::uniform_real_distribution<_RealType>::reset ()`
`[inline]`

Resets the distribution state.

Does nothing for the uniform real distribution.

Definition at line 1929 of file random.h.

4.953.5 Friends And Related Function Documentation

4.953.5.1 `template<typename _RealType = double> bool operator== (const uniform_real_distribution<_RealType> & __d1,`
`const uniform_real_distribution<_RealType> & __d2) [friend]`

Return true if two uniform real distributions have the same parameters.

Definition at line 2013 of file random.h.

4.956.1 Detailed Description

```
template<typename _Tp, typename _Dp = default_delete<_Tp>> class std::unique_ptr< _Tp, _Dp >
```

20.7.1.2 [unique_ptr](#) for single objects.

Definition at line 129 of file [unique_ptr.h](#).

4.956.2 Constructor & Destructor Documentation

4.956.2.1 `template<typename _Tp, typename _Dp = default_delete<_Tp>> constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr () [inline], [noexcept]`

Default constructor, creates a unique_ptr that owns nothing.

Definition at line 157 of file unique_ptr.h.

4.956.2.2 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (pointer __p) [inline], [explicit], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
------------------	---

The deleter will be value-initialized.

Definition at line 169 of file unique_ptr.h.

4.956.2.3 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (pointer __p, typename conditional< is_reference< deleter_type >::value, deleter_type, const deleter_type & >::type __d) [inline], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `__d`

Definition at line 181 of file unique_ptr.h.

4.956.2.4 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (pointer __p, typename remove_reference< deleter_type >::type && __d) [inline], [noexcept]`

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
<code>__d</code>	An rvalue reference to a deleter.

The deleter will be initialized with `std::move(__d)`

Definition at line 193 of file unique_ptr.h.

4.956.2.5 `template<typename _Tp, typename _Dp = default_delete<_Tp>> constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr (nullptr_t) [inline], [noexcept]`

Creates a unique_ptr that owns nothing.

Definition at line 200 of file unique_ptr.h.

4.956.2.6 `template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::unique_ptr (unique_ptr< _Tp, _Dp > && __u) [inline], [noexcept]`

Move constructor.

Definition at line 205 of file unique_ptr.h.

```
4.956.2.7 template<typename _Tp, typename _Dp = default_delete<_Tp>> template<typename _Up, typename _Ep, typename
= _Require< is_convertible<typename unique_ptr<_Up, _Ep>::pointer, pointer>, __not_<is_array<_Up>>,
typename conditional<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>::type>>
std::unique_ptr<_Tp, _Dp>::unique_ptr( unique_ptr<_Up, _Ep> &&__u ) [inline], [noexcept]
```

Converting constructor from another type.

Requires that the pointer owned by `__u` is convertible to the type of pointer owned by this object, `__u` does not own an array, and `__u` has a compatible deleter type.

Definition at line 220 of file `unique_ptr.h`.

```
4.956.2.8 template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr<_Tp, _Dp>::~unique_ptr( )
[inline], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

Definition at line 232 of file `unique_ptr.h`.

4.956.3 Member Function Documentation

```
4.956.3.1 template<typename _Tp, typename _Dp = default_delete<_Tp>> pointer std::unique_ptr<_Tp, _Dp>::get( void )
const [inline], [noexcept]
```

Return the stored pointer.

Definition at line 304 of file `unique_ptr.h`.

```
4.956.3.2 template<typename _Tp, typename _Dp = default_delete<_Tp>> deleter_type& std::unique_ptr<_Tp, _Dp
>::get_deleter( ) [inline], [noexcept]
```

Return a reference to the stored deleter.

Definition at line 309 of file `unique_ptr.h`.

Referenced by `std::unique_ptr< std::vector< bool > >::operator=()`, `std::unique_ptr< _Tp[], _Dp >::operator=()`, `std::unique_ptr< std::vector< bool > >::reset()`, `std::unique_ptr< _Tp[], _Dp >::reset()`, `std::unique_ptr< std::vector< bool > >::~unique_ptr()`, and `std::unique_ptr< _Tp[], _Dp >::~unique_ptr()`.

```
4.956.3.3 template<typename _Tp, typename _Dp = default_delete<_Tp>> const deleter_type& std::unique_ptr<_Tp, _Dp
>::get_deleter( ) const [inline], [noexcept]
```

Return a reference to the stored deleter.

Definition at line 314 of file `unique_ptr.h`.

```
4.956.3.4 template<typename _Tp, typename _Dp = default_delete<_Tp>> std::unique_ptr<_Tp, _Dp>::operator bool( )
const [inline], [explicit], [noexcept]
```

Return `true` if the stored pointer is not null.

Definition at line 318 of file `unique_ptr.h`.

```
4.956.3.5 template<typename _Tp, typename _Dp = default_delete<_Tp>> add_lvalue_reference<element_type>::type
std::unique_ptr<_Tp, _Dp>::operator*( ) const [inline]
```

Dereference the stored pointer.

Definition at line 288 of file `unique_ptr.h`.

4.956.3.6 `template<typename _Tp, typename _Dp = default_delete<_Tp>> pointer std::unique_ptr<_Tp, _Dp>::operator-> () const [inline], [noexcept]`

Return the stored pointer.

Definition at line 296 of file `unique_ptr.h`.

4.956.3.7 `template<typename _Tp, typename _Dp = default_delete<_Tp>> unique_ptr& std::unique_ptr<_Tp, _Dp>::operator=(unique_ptr<_Tp, _Dp> && __u) [inline], [noexcept]`

Move assignment operator.

Parameters

<code>__u</code>	The object to transfer ownership from.
------------------	--

Invokes the deleter first if this object owns a pointer.

Definition at line 249 of file `unique_ptr.h`.

4.956.3.8 `template<typename _Tp, typename _Dp = default_delete<_Tp>> template<typename _Up, typename _Ep> enable_if< __and< is_convertible<typename unique_ptr<_Up, _Ep>::pointer, pointer>, __not<is_array<_Up>>>::value, unique_ptr&>::type std::unique_ptr<_Tp, _Dp>::operator=(unique_ptr<_Up, _Ep> && __u) [inline], [noexcept]`

Assignment from another type.

Parameters

<code>__u</code>	The object to transfer ownership from, which owns a convertible pointer to a non-array object.
------------------	--

Invokes the deleter first if this object owns a pointer.

Definition at line 269 of file `unique_ptr.h`.

4.956.3.9 `template<typename _Tp, typename _Dp = default_delete<_Tp>> unique_ptr& std::unique_ptr<_Tp, _Dp>::operator=(nullptr_t) [inline], [noexcept]`

Reset the `unique_ptr` to empty, invoking the deleter if necessary.

Definition at line 278 of file `unique_ptr.h`.

4.956.3.10 `template<typename _Tp, typename _Dp = default_delete<_Tp>> pointer std::unique_ptr<_Tp, _Dp>::release () [inline], [noexcept]`

Release ownership of any stored pointer.

Definition at line 325 of file `unique_ptr.h`.

4.956.3.11 `template<typename _Tp, typename _Dp = default_delete<_Tp>> void std::unique_ptr<_Tp, _Dp>::reset (pointer __p=pointer()) [inline], [noexcept]`

Replace the stored pointer.

Parameters

<code>__p</code>	The new pointer to store.
------------------	---------------------------

The deleter will be invoked if a pointer is already owned.

Definition at line 339 of file `unique_ptr.h`.

Referenced by `std::unique_ptr< std::vector< bool >>::operator=()`, and `std::unique_ptr<_Tp[], _Dp>::operator=()`.

4.956.3.12 `template<typename _Tp, typename _Dp = default_delete<_Tp>> void std::unique_ptr< _Tp, _Dp >::swap (unique_ptr< _Tp, _Dp > &__u) [inline], [noexcept]`

Exchange the pointer and deleter with another object.

Definition at line 349 of file `unique_ptr.h`.

Referenced by `std::unique_ptr< std::vector< bool > >::reset()`, `std::unique_ptr< _Tp[], _Dp >::reset()`, `std::unique_ptr< std::vector< bool > >::swap()`, and `std::unique_ptr< _Tp[], _Dp >::swap()`.

4.957.1 Detailed Description

template<typename _Tp, typename _Dp>class std::unique_ptr< _Tp[], _Dp >

20.7.1.3 unique_ptr for array objects with a runtime length

Definition at line 365 of file unique_ptr.h.

4.957.2 Constructor & Destructor Documentation

4.957.2.1 template<typename _Tp, typename _Dp > constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr ()
[inline], [noexcept]

Default constructor, creates a unique_ptr that owns nothing.

Definition at line 414 of file unique_ptr.h.

4.957.2.2 template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (pointer __p)
[inline], [explicit], [noexcept]

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of <code>element_type</code>
------------------	--

The deleter will be value-initialized.

Definition at line 426 of file unique_ptr.h.

4.957.2.3 template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (pointer __p, typename
conditional< is_reference< deleter_type >::value, deleter_type, const deleter_type & >::type __d) [inline],
[noexcept]

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `__d`

Definition at line 444 of file unique_ptr.h.

4.957.2.4 template<typename _Tp, typename _Dp > std::unique_ptr< _Tp[], _Dp >::unique_ptr (pointer __p, typename
remove_reference< deleter_type >::type && __d) [inline], [noexcept]

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `std::move(__d)`

Definition at line 456 of file `unique_ptr.h`.

4.957.2.5 `template<typename _Tp, typename _Dp> std::unique_ptr<_Tp[], _Dp>::unique_ptr(unique_ptr<_Tp[], _Dp> &&__u) [inline], [noexcept]`

Move constructor.

Definition at line 463 of file `unique_ptr.h`.

4.957.2.6 `template<typename _Tp, typename _Dp> constexpr std::unique_ptr<_Tp[], _Dp>::unique_ptr(nullptr_t) [inline], [noexcept]`

Creates a `unique_ptr` that owns nothing.

Definition at line 467 of file `unique_ptr.h`.

4.957.2.7 `template<typename _Tp, typename _Dp> std::unique_ptr<_Tp[], _Dp>::~~unique_ptr() [inline]`

Destructor, invokes the deleter if the stored pointer is not null.

Definition at line 480 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::get_deleter()`.

4.957.3 Member Function Documentation

4.957.3.1 `template<typename _Tp, typename _Dp> pointer std::unique_ptr<_Tp[], _Dp>::get(void) const [inline], [noexcept]`

Return the stored pointer.

Definition at line 541 of file `unique_ptr.h`.

4.957.3.2 `template<typename _Tp, typename _Dp> deleter_type& std::unique_ptr<_Tp[], _Dp>::get_deleter() [inline], [noexcept]`

Return a reference to the stored deleter.

Definition at line 546 of file `unique_ptr.h`.

4.957.3.3 `template<typename _Tp, typename _Dp> const deleter_type& std::unique_ptr<_Tp[], _Dp>::get_deleter() const [inline], [noexcept]`

Return a reference to the stored deleter.

Definition at line 551 of file `unique_ptr.h`.

4.957.3.4 `template<typename _Tp, typename _Dp> std::unique_ptr<_Tp[], _Dp>::operator bool() const [inline], [explicit], [noexcept]`

Return `true` if the stored pointer is not null.

Definition at line 555 of file `unique_ptr.h`.

```
4.957.3.5 template<typename _Tp , typename _Dp > unique_ptr& std::unique_ptr<_Tp[],_Dp>::operator= (  
    unique_ptr<_Tp[],_Dp> &&__u ) [inline],[noexcept]
```

Move assignment operator.

Parameters

<code>__u</code>	The object to transfer ownership from.
------------------	--

Invokes the deleter first if this object owns a pointer.

Definition at line 497 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::get_deleter()`, and `std::unique_ptr<_Tp, _Dp>::reset()`.

4.957.3.6 `template<typename _Tp, typename _Dp> template<typename _Up, typename _Ep> enable_if<__safe_conversion<_Up, _Ep>::value, unique_ptr&::type> std::unique_ptr<_Tp[], _Dp>::operator= (unique_ptr<_Up, _Ep> && __u) [inline], [noexcept]`

Assignment from another type.

Parameters

<code>__u</code>	The object to transfer ownership from, which owns a convertible pointer to an array object.
------------------	---

Invokes the deleter first if this object owns a pointer.

Definition at line 514 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::get_deleter()`, and `std::unique_ptr<_Tp, _Dp>::reset()`.

4.957.3.7 `template<typename _Tp, typename _Dp> unique_ptr& std::unique_ptr<_Tp[], _Dp>::operator= (nullptr_t) [inline], [noexcept]`

Reset the `unique_ptr` to empty, invoking the deleter if necessary.

Definition at line 523 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::reset()`.

4.957.3.8 `template<typename _Tp, typename _Dp> std::add_lvalue_reference<element_type>::type std::unique_ptr<_Tp[], _Dp>::operator[] (size_t __i) const [inline]`

Access an element of owned array.

Definition at line 533 of file `unique_ptr.h`.

4.957.3.9 `template<typename _Tp, typename _Dp> pointer std::unique_ptr<_Tp[], _Dp>::release () [inline], [noexcept]`

Release ownership of any stored pointer.

Definition at line 562 of file `unique_ptr.h`.

4.957.3.10 `template<typename _Tp, typename _Dp> void std::unique_ptr<_Tp[], _Dp>::reset (pointer __p = pointer()) [inline], [noexcept]`

Replace the stored pointer.

Parameters

<code>__p</code>	The new pointer to store.
------------------	---------------------------

The deleter will be invoked if a pointer is already owned.

Definition at line 576 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::get_deleter()`, `std::unique_ptr<_Tp, _Dp>::swap()`, and `std::swap()`.

4.957.3.11 `template<typename _Tp, typename _Dp> void std::unique_ptr<_Tp[], _Dp>::swap (unique_ptr<_Tp[], _Dp> & __u) [inline], [noexcept]`

Exchange the pointer and deleter with another object.

Definition at line 591 of file `unique_ptr.h`.

References `std::unique_ptr<_Tp, _Dp>::swap()`, and `std::swap()`.

4.958.1 Detailed Description

`template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> class std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>`

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator<std::pair<const _Key, _Tp>></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

Definition at line 98 of file `unordered_map.h`.

4.958.2 Member Typedef Documentation

4.958.3 Constructor & Destructor Documentation

```
4.958.3.1  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_map ( size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf =
key_equal(), const allocator_type & __a = allocator_type() ) [inline],[explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 139 of file unordered_map.h.

```
4.958.3.2  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map ( _InputIterator __f, _InputIterator __l, size_type __n = 0,
const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a =
allocator_type() ) [inline]
```

Builds an unordered_map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_map consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

Definition at line 160 of file unordered_map.h.

4.958.3.3 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map (const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> &) [default]`

Copy constructor.

4.958.3.4 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map (unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> &&) [default]`

Move constructor.

4.958.3.5 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map (const allocator_type &__a) [inline],[explicit]`

Creates an unordered_map with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 179 of file unordered_map.h.

4.958.3.6 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map (initializer_list<value_type> __l, size_type __n = 0, const hasher &__hf = hasher(), const key_equal &__eqf = key_equal(), const allocator_type &__a = allocator_type()) [inline]`

Builds an unordered_map from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_map consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 214 of file unordered_map.h.

4.958.4 Member Function Documentation

4.958.4.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::at (const key_type &__k) [inline]`

Access to unordered_map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the unordered_map.

Exceptions

<i>std::out_of_range</i>	If no such data is present.
--------------------------	-----------------------------

Definition at line 643 of file unordered_map.h.

```
4.958.4.2  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const mapped_type& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::at ( const key_type & __k ) const    [inline]
```

Access to unordered_map data.

Parameters

<i>__k</i>	The key for which data should be retrieved.
------------	---

Returns

A reference to the data whose key is equal to *__k*, if such a data is present in the unordered_map.

Exceptions

<i>std::out_of_range</i>	If no such data is present.
--------------------------	-----------------------------

Definition at line 647 of file unordered_map.h.

```
4.958.4.3  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::begin ( )    [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered_map.

Definition at line 278 of file unordered_map.h.

```
4.958.4.4  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::begin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

Definition at line 287 of file unordered_map.h.

```
4.958.4.5  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::begin ( size_type __n )    [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

<i>__n</i>	The bucket index.
------------	-------------------

Returns

A read/write local iterator.

Definition at line 688 of file unordered_map.h.

4.958.4.6 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::begin (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 699 of file `unordered_map.h`.

```
4.958.4.7  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
           std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
           >::bucket_count( ) const    [inline], [noexcept]
```

Returns the number of buckets of the `unordered_map`.

Definition at line 655 of file `unordered_map.h`.

```
4.958.4.8  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
           std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
           _Alloc>::cbegin( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

Definition at line 291 of file `unordered_map.h`.

```
4.958.4.9  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
           std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
           _Pred, _Alloc>::cbegin( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 703 of file `unordered_map.h`.

```
4.958.4.10 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
           std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
           _Alloc>::cend( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_map`.

Definition at line 313 of file `unordered_map.h`.

```
4.958.4.11 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
           std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
           _Pred, _Alloc>::cend( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 729 of file unordered_map.h.

```
4.958.4.12 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::clear ( ) [inline], [noexcept]
```

Erases all elements in an unordered_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 527 of file unordered_map.h.

```
4.958.4.13 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::count ( const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>__x</code>	Key to count.
------------------	---------------

Returns

Number of elements with specified key.

This function only makes sense for unordered_multimap; for unordered_map the result will either be 0 (not present) or 1 (present).

Definition at line 591 of file unordered_map.h.

```
4.958.4.14 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>> template<typename... _Args> std::pair<iterator, bool>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.

Insertion requires amortized constant time.

Definition at line 340 of file unordered_map.h.

4.958.4.15 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (const_iterator __pos, _Args &&... __args) [inline]`

Attempts to build and insert a `std::pair` into the `unordered_map`.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 370 of file `unordered_map.h`.

4.958.4.16 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::empty () const [inline], [noexcept]`

Returns true if the `unordered_map` is empty.

Definition at line 258 of file `unordered_map.h`.

4.958.4.17 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end () [inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the `unordered_map`.

Definition at line 300 of file `unordered_map.h`.

4.958.4.18 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_map`.

Definition at line 309 of file `unordered_map.h`.

4.958.4.19 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end (size_type __n) [inline]`

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 714 of file unordered_map.h.

```
4.958.4.20 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,  
_Pred, _Alloc>::end ( size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 725 of file unordered_map.h.

```
4.958.4.21 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::unordered_map<_Key, _Tp,  
_Hash, _Pred, _Alloc>::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

Definition at line 604 of file unordered_map.h.

```
4.958.4.22 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class  
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::pair<const_iterator, const_iterator>  
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::equal_range ( const key_type & __x ) const  
[inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for `unordered_multimap`.

Definition at line 608 of file `unordered_map.h`.

```
4.958.4.23  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( const_iterator __position ) [inline]
```

Erases an element from an `unordered_map`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 477 of file `unordered_map.h`.

```
4.958.4.24  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( iterator __it ) [inline]
```

Erases an element from an `unordered_map`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 482 of file `unordered_map.h`.

```
4.958.4.25  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::erase( const key_type &__x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_map`. For an `unordered_map` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 499 of file `unordered_map.h`.

```
4.958.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::erase( const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_map`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 517 of file `unordered_map.h`.

```
4.958.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::find( const key_type &__x ) [inline]
```

Tries to locate an element in an `unordered_map`.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 573 of file `unordered_map.h`.

```
4.958.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::find( const key_type &__x ) const [inline]
```

Tries to locate an element in an `unordered_map`.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 577 of file `unordered_map.h`.

std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::get_allocator ( ) const    [inline], [noexcept]
```

Returns the allocator object with which the `unordered_map` was constructed.

Definition at line 251 of file `unordered_map.h`.

```
4.958.4.30  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> hasher std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::hash_function ( ) const    [inline]
```

Returns the hash functor object with which the `unordered_map` was constructed.

Definition at line 549 of file `unordered_map.h`.

```
4.958.4.31  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::unordered_map<_Key, _Tp,
_Hash, _Pred, _Alloc>::insert ( const value_type & __x )    [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 392 of file `unordered_map.h`.

```
4.958.4.32  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _Pair, typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> std::pair<iterator, bool>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::insert ( _Pair && __x )    [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 399 of file `unordered_map.h`.

```
4.958.4.33 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::insert( const_iterator __hint, const value_type & __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 426 of file `unordered_map.h`.

```
4.958.4.34 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair, typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_map<_Key,
_Tp, _Hash, _Pred, _Alloc>::insert( const_iterator __hint, _Pair && __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 433 of file `unordered_map.h`.

```
4.958.4.35  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =

            _Key, _Tp, _Hash, _Pred, _Alloc >::insert( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 448 of file `unordered_map.h`.

```
4.958.4.36  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =

            >::load_factor( ) const [inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 737 of file `unordered_map.h`.

```
4.958.4.39 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_bucket_count( ) const [inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_map.

Definition at line 660 of file unordered_map.h.

```
4.958.4.40 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_load_factor( ) const [inline], [noexcept]
```

Returns a positive number that the unordered_map tries to keep the load factor less than or equal to.

Definition at line 743 of file unordered_map.h.

```
4.958.4.41 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_load_factor( float __z ) [inline]
```

Change the unordered_map maximum load factor.

Parameters

__z	The new maximum load factor.
-----	------------------------------

Definition at line 751 of file unordered_map.h.

```
4.958.4.42 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_size( ) const [inline], [noexcept]
```

Returns the maximum size of the unordered_map.

Definition at line 268 of file unordered_map.h.

```
4.958.4.43 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::noexcept( noexcept(_M_h.swap(__x._M_h)) ) [inline]
```

Swaps data with another unordered_map.

Parameters

__x	An unordered_map of the same element and allocator types.
-----	---

This exchanges the elements between two unordered_map in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 541 of file unordered_map.h.

```
4.958.4.44 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::operator=( const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]
```

Copy assignment operator.

4.958.4.45 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator= (unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> &&) [default]`

Move assignment operator.

4.958.4.46 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator= (initializer_list<value_type> __l) [inline]`

Unordered_map list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered_map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_map and that the resulting unordered_map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 242 of file unordered_map.h.

4.958.4.47 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator[](const key_type & __k) [inline]`

Subscript (`[]`) access to unordered_map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript (`[]`) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 626 of file unordered_map.h.

4.958.4.48 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator[](key_type && __k) [inline]`

Subscript (`[]`) access to unordered_map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript (`[]`) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 630 of file unordered_map.h.

```
4.958.4.49 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::rehash( size_type __n ) [inline]
```

May rehash the unordered_map.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_map maximum load factor.

Definition at line 762 of file unordered_map.h.

```
4.958.4.50 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::reserve( size_type __n ) [inline]
```

Prepare the unordered_map for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as rehash(ceil(n / max_load_factor())).

Definition at line 773 of file unordered_map.h.

```
4.958.4.51 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::size( ) const [inline], [noexcept]
```

Returns the size of the unordered_map.

Definition at line 263 of file unordered_map.h.

4.959.1 Detailed Description

```
template<class _Key, class _Tp, class _Hash = hash< _Key>, class _Pred = std::equal_to< _Key>, class _Alloc = std::allocator<std-
::pair<const _Key, _Tp>>> class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator<std::pair<const _Key, _Tp>></code> .

Meets the requirements of a **container**, and **unordered associative container**

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

Definition at line 810 of file `unordered_map.h`.

4.959.3 Constructor & Destructor Documentation

4.959.3.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_multimap (size_type __n=10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline],[explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 851 of file `unordered_map.h`.

4.959.3.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_multimap (_InputIterator __f, _InputIterator __l, size_type __n=0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]`

Builds an `unordered_multimap` from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

Definition at line 872 of file `unordered_map.h`.

```
4.959.3.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( const unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]
```

Copy constructor.

```
4.959.3.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> && ) [default]
```

Move constructor.

```
4.959.3.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( const allocator_type & __a ) [inline],[explicit]
```

Creates an `unordered_multimap` with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 891 of file `unordered_map.h`.

```
4.959.3.6 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( initializer_list<value_type> & __l, size_type __n = 0, const hasher & __hf =
hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() )
[inline]
```

Builds an `unordered_multimap` from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements in the list. This is linear in `N` (where `N` is `__l.size()`).

Definition at line 926 of file `unordered_map.h`.

4.959.4 Member Function Documentation

4.959.4.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the `unordered_multimap`.

Definition at line 990 of file `unordered_map.h`.

4.959.4.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_multimap`.

Definition at line 999 of file `unordered_map.h`.

4.959.4.3 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin (size_type __n) [inline]`

Returns a read/write iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 1339 of file `unordered_map.h`.

4.959.4.4 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1350 of file `unordered_map.h`.

4.959.4.5 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::bucket_count () const [inline], [noexcept]`

Returns the number of buckets of the `unordered_multimap`.

Definition at line 1306 of file `unordered_map.h`.

4.959.4.6 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

Definition at line 1003 of file unordered_map.h.

4.959.4.7 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cbegin (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1354 of file unordered_map.h.

4.959.4.8 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Definition at line 1025 of file unordered_map.h.

4.959.4.9 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cend (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1380 of file unordered_map.h.

4.959.4.10 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in an unordered_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1222 of file unordered_map.h.

4.959.4.11 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::count (const key_type & __x) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Key to count.
------------------	---------------

Returns

Number of elements with specified key.

Definition at line 1283 of file unordered_map.h.

```
4.959.4.12 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>,
class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered_multimap.

Insertion requires amortized constant time.

Definition at line 1048 of file unordered_map.h.

```
4.959.4.13 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>,
class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args
&&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from __args.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1074 of file unordered_map.h.

4.959.4.14 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> bool std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::empty() const [inline], [noexcept]`

Returns true if the unordered_multimap is empty.

Definition at line 970 of file unordered_map.h.

4.959.4.15 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end() [inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the unordered_multimap.

Definition at line 1012 of file unordered_map.h.

4.959.4.16 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end() const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Definition at line 1021 of file unordered_map.h.

4.959.4.17 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end(size_type __n) [inline]`

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 1365 of file unordered_map.h.

4.959.4.18 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end(size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1376 of file `unordered_map.h`.

```
4.959.4.19 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::unordered_multimap<  
_Key, _Tp, _Hash, _Pred, _Alloc>::equal_range( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1294 of file `unordered_map.h`.

```
4.959.4.20 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
        _Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator>
        std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const
        [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1298 of file `unordered_map.h`.

```
4.959.4.21 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
        std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
        _Alloc >::erase ( const_iterator __position ) [inline]
```

Erases an element from an `unordered_multimap`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1172 of file `unordered_map.h`.

```
4.959.4.22 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
        std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
        _Alloc >::erase ( iterator __it ) [inline]
```

Erases an element from an `unordered_multimap`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1177 of file `unordered_map.h`.

```
4.959.4.23  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
            _Alloc >::erase( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of elements to be erased.
------------------	-------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1193 of file `unordered_map.h`.

```
4.959.4.24  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
            _Alloc >::erase( const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`, `__last`) range of elements from an `unordered_multimap`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1212 of file `unordered_map.h`.

4.959.4.25 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::find (const key_type &__x) [inline]`

Tries to locate an element in an unordered_multimap.

Parameters

__x	Key to be located.
-----	--------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 1269 of file unordered_map.h.

```
4.959.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap< _Key, _Tp, _Hash,
_Pred, _Alloc>::find ( const key_type & __x ) const [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

__x	Key to be located.
-----	--------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

Definition at line 1273 of file unordered_map.h.

```
4.959.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::unordered_multimap< _Key, _Tp, _Hash,
_Pred, _Alloc>::get_allocator ( ) const [inline],[noexcept]
```

Returns the allocator object with which the unordered_multimap was constructed.

Definition at line 963 of file unordered_map.h.

```
4.959.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
_Alloc>::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_multimap was constructed.

Definition at line 1245 of file unordered_map.h.

```
4.959.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
_Alloc>::insert ( const value_type & __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1088 of file `unordered_map.h`.

```
4.959.4.30  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
            _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair, typename = typename
            std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap<
            _Key, _Tp, _Hash, _Pred, _Alloc >::insert( _Pair && __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1095 of file `unordered_map.h`.

```
4.959.4.31  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
            _Alloc >::insert( const_iterator __hint, const value_type & __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1120 of file `unordered_map.h`.

```
4.959.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
    _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair, typename = typename
    std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap<
    _Key, _Tp, _Hash, _Pred, _Alloc >::insert( const_iterator __hint, _Pair && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1127 of file `unordered_map.h`.

```
4.959.4.33 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
    _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator > void
    std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert ( _InputIterator __first, _InputIterator __last )
    [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 1142 of file `unordered_map.h`.

```
4.959.4.34 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
    std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
    >::insert ( initializer_list<value_type> __l ) [inline]
```

Attempts to insert a list of elements into the `unordered_multimap`.

Parameters

<code>__l</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 1154 of file `unordered_map.h`.

```
4.959.4.35 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
    std::allocator<std::pair<const _Key, _Tp>>> key_equal std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
    _Alloc>::key_eq ( ) const [inline]
```

Returns the key comparison object with which the `unordered_multimap` was constructed.

Definition at line 1251 of file `unordered_map.h`.

```
4.959.4.36 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
    std::allocator<std::pair<const _Key, _Tp>>> float std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
    >::load_factor ( ) const [inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1388 of file unordered_map.h.

```
4.959.4.37 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::max_bucket_count( ) const [inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multimap.

Definition at line 1311 of file unordered_map.h.

```
4.959.4.38 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> float std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_load_factor( ) const [inline], [noexcept]
```

Returns a positive number that the unordered_multimap tries to keep the load factor less than or equal to.

Definition at line 1394 of file unordered_map.h.

```
4.959.4.39 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::max_load_factor( float __z ) [inline]
```

Change the unordered_multimap maximum load factor.

Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 1402 of file unordered_map.h.

```
4.959.4.40 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::max_size( ) const [inline], [noexcept]
```

Returns the maximum size of the unordered_multimap.

Definition at line 980 of file unordered_map.h.

```
4.959.4.41 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::noexcept( noexcept(_M_h.swap(__x._M_h)) ) [inline]
```

Swaps data with another unordered_multimap.

Parameters

<code>__x</code>	An unordered_multimap of the same element and allocator types.
------------------	--

This exchanges the elements between two unordered_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

Definition at line 1237 of file unordered_map.h.

```
4.959.4.42 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key,
_Tp, _Hash, _Pred, _Alloc>::operator=( const unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> & )
[default]
```

Copy assignment operator.

4.959.4.43 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::operator= (unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> &&)`
`[default]`

Move assignment operator.

4.959.4.44 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::operator= (initializer_list<value_type> __l)` `[inline]`

Unordered_multimap list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered_multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 954 of file unordered_map.h.

4.959.4.45 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::rehash (size_type __n)` `[inline]`

May rehash the unordered_multimap.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.

Definition at line 1413 of file unordered_map.h.

4.959.4.46 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::reserve (size_type __n)` `[inline]`

Prepare the unordered_multimap for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1424 of file unordered_map.h.

4.959.4.47 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::size () const` `[inline]`, `[noexcept]`

Returns the size of the unordered_multimap.

Definition at line 975 of file unordered_map.h.

4.960.1 Detailed Description

template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to hash<_Value>.
<code>_Pred</code>	Predicate function object type, defaults to equal_to<_Value>.
<code>_Alloc</code>	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is _Hashtable, dispatched at compile time via template alias __umset_hashtable.

Definition at line 728 of file unordered_set.h.

4.960.3 Constructor & Destructor Documentation

4.960.3.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 767 of file unordered_set.h.

4.960.3.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (_InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]`

Builds an unordered_multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multiset` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

Definition at line 788 of file `unordered_set.h`.

```
4.960.3.3  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::unordered_multiset (
            const unordered_multiset<_Value, _Hash, _Pred, _Alloc> & ) [default]
```

Copy constructor.

```
4.960.3.4  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::unordered_multiset (
            unordered_multiset<_Value, _Hash, _Pred, _Alloc> && ) [default]
```

Move constructor.

```
4.960.3.5  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::unordered_multiset (
            initializer_list<value_type> & __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal &
            __eqf = key_equal(), const allocator_type & __a = allocator_type()) [inline]
```

Builds an `unordered_multiset` from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multiset` consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 813 of file `unordered_set.h`.

```
4.960.3.6  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::unordered_multiset (
            const allocator_type & __a ) [inline],[explicit]
```

Creates an `unordered_multiset` with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 834 of file `unordered_set.h`.

4.960.4 Member Function Documentation

4.960.4.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ()`
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 907 of file unordered_set.h.

4.960.4.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ()`
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

Definition at line 911 of file unordered_set.h.

4.960.4.3 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (`
`size_type __n) [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1235 of file unordered_set.h.

4.960.4.4 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin`
`(size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1239 of file unordered_set.h.

4.960.4.5 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count ()`
`const [inline], [noexcept]`

Returns the number of buckets of the unordered_multiset.

Definition at line 1201 of file unordered_set.h.

4.960.4.6 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

Definition at line 934 of file `unordered_set.h`.

4.960.4.7 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cbegin (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1243 of file `unordered_set.h`.

4.960.4.8 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Definition at line 942 of file `unordered_set.h`.

4.960.4.9 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cend (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1263 of file `unordered_set.h`.

4.960.4.10 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in an `unordered_multiset`.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1118 of file `unordered_set.h`.

4.960.4.11 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::count (const key_type & __x) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Element to located.
------------------	---------------------

Returns

Number of elements with specified key.

Definition at line 1178 of file `unordered_set.h`.

```
4.960.4.12  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash,
            _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]
```

Builds and insert an element into the `unordered_multiset`.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 956 of file `unordered_set.h`.

```
4.960.4.13  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash,
            _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires amortized constant time.

Definition at line 978 of file `unordered_set.h`.

```
4.960.4.14  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty ( ) const
            [inline], [noexcept]
```

Returns true if the `unordered_multiset` is empty.

Definition at line 886 of file `unordered_set.h`.

```
4.960.4.15 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( )
[inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 921 of file unordered_set.h.

```
4.960.4.16 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Definition at line 925 of file unordered_set.h.

```
4.960.4.17 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1255 of file unordered_set.h.

```
4.960.4.18 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end
( size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1259 of file unordered_set.h.

```
4.960.4.19 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_multiset< _Value, _Hash, _Pred,
_Alloc >::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1189 of file `unordered_set.h`.

```
4.960.4.20  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_multiset< _Value,
            _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1193 of file `unordered_set.h`.

```
4.960.4.21  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position )    [inline]
```

Erases an element from an `unordered_multiset`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1064 of file `unordered_set.h`.

```
4.960.4.22  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase ( iterator
            __it )    [inline]
```

Erases an element from an `unordered_multiset`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1069 of file `unordered_set.h`.

```
4.960.4.23  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase ( const
            key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1087 of file `unordered_set.h`.

```
4.960.4.24  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multiset`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1107 of file `unordered_set.h`.

4.960.4.25 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (const
key_type & __x) [inline]`

Tries to locate an element in an unordered_multiset.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1164 of file `unordered_set.h`.

```
4.960.4.26 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find ( const
key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_multiset`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1168 of file `unordered_set.h`.

```
4.960.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the `unordered_multiset` was constructed.

Definition at line 879 of file `unordered_set.h`.

```
4.960.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( )
const [inline]
```

Returns the hash functor object with which the `unordered_multiset` was constructed.

Definition at line 1140 of file `unordered_set.h`.

```
4.960.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert ( const
value_type & __x ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 990 of file `unordered_set.h`.

```
4.960.4.30  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            value_type && __x ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 994 of file `unordered_set.h`.

```
4.960.4.31  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint, const value_type && __x ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires amortized constant.

Definition at line 1016 of file `unordered_set.h`.

```
4.960.4.32  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint, value_type && __x ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires amortized constant.

Definition at line 1020 of file unordered_set.h.

```
4.960.4.33 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator > void std::unordered_multiset< _Value, _Hash,
_Pred, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that inserts a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 1034 of file unordered_set.h.

```
4.960.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
initializer_list< value_type > __l ) [inline]
```

Inserts a list of elements into the unordered_multiset.

Parameters

<code>__l</code>	A std::initializer_list<value_type> of elements to be inserted.
------------------	---

Complexity similar to that of the range constructor.

Definition at line 1045 of file unordered_set.h.

```
4.960.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq ( )
const [inline]
```

Returns the key comparison object with which the unordered_multiset was constructed.

Definition at line 1146 of file unordered_set.h.

```
4.960.4.36 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const
[inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1271 of file unordered_set.h.

4.960.4.37 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_bucket_count() const [inline], [noexcept]`

Returns the maximum number of buckets of the `unordered_multiset`.

Definition at line 1206 of file `unordered_set.h`.

4.960.4.38 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_load_factor() const [inline], [noexcept]`

Returns a positive number that the `unordered_multiset` tries to keep the load factor less than or equal to.

Definition at line 1277 of file `unordered_set.h`.

4.960.4.39 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_load_factor(float __z) [inline]`

Change the `unordered_multiset` maximum load factor.

Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 1285 of file `unordered_set.h`.

4.960.4.40 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_size() const [inline], [noexcept]`

Returns the maximum size of the `unordered_multiset`.

Definition at line 896 of file `unordered_set.h`.

4.960.4.41 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::noexcept(noexcept(_M_h.swap(__x._M_h))) [inline]`

Swaps data with another `unordered_multiset`.

Parameters

<code>__x</code>	An <code>unordered_multiset</code> of the same element and allocator types.
------------------	---

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 1132 of file `unordered_set.h`.

4.960.4.42 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::operator=(const unordered_multiset<_Value, _Hash, _Pred, _Alloc> &) [default]`

Copy assignment operator.

```
4.960.4.43 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::operator= ( unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

```
4.960.4.44 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::operator= ( initializer_list< value_type > __l ) [inline]
```

Unordered_multiset list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered_multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_multiset and that the resulting unordered_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 870 of file unordered_set.h.

```
4.960.4.45 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash ( size_type __n
) [inline]
```

May rehash the unordered_multiset.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.

Definition at line 1296 of file unordered_set.h.

```
4.960.4.46 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve ( size_type
__n ) [inline]
```

Prepare the unordered_multiset for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as rehash(ceil(n / max_load_factor())).

Definition at line 1307 of file unordered_set.h.

```
4.960.4.47 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size ( ) const
[inline], [noexcept]
```

Returns the size of the unordered_multiset.

Definition at line 891 of file unordered_set.h.

- `template<typename _Value1, typename _Hash1, typename _Pred1, typename _Alloc1 >`
`bool operator==(const unordered_set<_Value1, _Hash1, _Pred1, _Alloc1 > &, const unordered_set<_Value1, _Hash1, _Pred1, _Alloc1 > &)`

4.961.1 Detailed Description

`template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> class std::unordered_set<_Value, _Hash, _Pred, _Alloc >`

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

Definition at line 93 of file `unordered_set.h`.

4.961.3 Constructor & Destructor Documentation

4.961.3.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set(size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eq = key_equal(), const allocator_type & __a = allocator_type()) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 132 of file `unordered_set.h`.

4.961.3.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename _InputIterator> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set(_InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eq = key_equal(), const allocator_type & __a = allocator_type()) [inline]`

Builds an `unordered_set` from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_set` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

Definition at line 153 of file `unordered_set.h`.

```
4.961.3.3 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set ( const
unordered_set<_Value, _Hash, _Pred, _Alloc> & ) [default]
```

Copy constructor.

```
4.961.3.4 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set (
unordered_set<_Value, _Hash, _Pred, _Alloc> && ) [default]
```

Move constructor.

```
4.961.3.5 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set ( const
allocator_type & __a ) [inline],[explicit]
```

Creates an `unordered_set` with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 172 of file `unordered_set.h`.

```
4.961.3.6 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::unordered_set (
initializer_list<value_type> __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal &
__eqf = key_equal(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds an `unordered_set` from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_set` consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 207 of file `unordered_set.h`.

4.961.4 Member Function Documentation

4.961.4.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin () [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 272 of file `unordered_set.h`.

4.961.4.2 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 276 of file `unordered_set.h`.

4.961.4.3 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin (size_type __n) [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 623 of file `unordered_set.h`.

4.961.4.4 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 627 of file `unordered_set.h`.

4.961.4.5 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::bucket_count () const [inline], [noexcept]`

Returns the number of buckets of the `unordered_set`.

Definition at line 589 of file `unordered_set.h`.

4.961.4.6 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

Definition at line 299 of file unordered_set.h.

4.961.4.7 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cbegin (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 631 of file unordered_set.h.

4.961.4.8 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

Definition at line 307 of file unordered_set.h.

4.961.4.9 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::cend (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 651 of file unordered_set.h.

4.961.4.10 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::clear () [inline], [noexcept]`

Erases all elements in an unordered_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 500 of file unordered_set.h.

4.961.4.11 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::count (const
key_type & __x) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Element to located.
------------------	---------------------

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

Definition at line 564 of file unordered_set.h.

```
4.961.4.12 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename... _Args> std::pair<iterator, bool> std::unordered_set<
_Value, _Hash, _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]
```

Attempts to build and insert an element into the unordered_set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

Definition at line 329 of file unordered_set.h.

```
4.961.4.13 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename... _Args> iterator std::unordered_set< _Value, _Hash, _Pred,
_Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires amortized constant time.

Definition at line 355 of file unordered_set.h.

4.961.4.14 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> bool std::unordered_set<_Value, _Hash, _Pred, _Alloc>::empty () const [inline], [noexcept]`

Returns true if the `unordered_set` is empty.

Definition at line 251 of file `unordered_set.h`.

4.961.4.15 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end () [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 286 of file `unordered_set.h`.

4.961.4.16 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 290 of file `unordered_set.h`.

4.961.4.17 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end (size_type __n) [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 643 of file `unordered_set.h`.

4.961.4.18 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end (size_type __n) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 647 of file unordered_set.h.

```
4.961.4.19 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_set<_Value, _Hash, _Pred, _Alloc  
>::equal_range( const key_type &__x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 577 of file `unordered_set.h`.

```
4.961.4.20  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_set<_Value, _Hash,
            _Pred, _Alloc>::equal_range ( const key_type & __x ) const    [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 581 of file `unordered_set.h`.

```
4.961.4.21  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( const_iterator
            __position )    [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 450 of file `unordered_set.h`.

```
4.961.4.22  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( iterator __it )
            [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 455 of file `unordered_set.h`.

```
4.961.4.23  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase ( const
            key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 472 of file `unordered_set.h`.

```
4.961.4.24  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase ( const_iterator
            __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 490 of file `unordered_set.h`.

4.961.4.25 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::find (const key_type &
__x) [inline]`

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 546 of file `unordered_set.h`.

```
4.961.4.26 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::find ( const
key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 550 of file `unordered_set.h`.

```
4.961.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> allocator_type std::unordered_set<_Value, _Hash, _Pred, _Alloc >::get_allocator ( )
const [inline], [noexcept]
```

Returns the allocator object with which the `unordered_set` was constructed.

Definition at line 244 of file `unordered_set.h`.

```
4.961.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> hasher std::unordered_set<_Value, _Hash, _Pred, _Alloc >::hash_function ( ) const
[inline]
```

Returns the hash functor object with which the `unordered_set` was constructed.

Definition at line 522 of file `unordered_set.h`.

```
4.961.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert
( const value_type & __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 373 of file `unordered_set.h`.

```
4.961.4.30  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert
            ( value_type && __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 377 of file `unordered_set.h`.

```
4.961.4.31  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert ( const_iterator
            __hint, const value_type & __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires amortized constant.

Definition at line 402 of file unordered_set.h.

```
4.961.4.32 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert ( const_iterator
__hint, value_type && __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.-html>

Insertion requires amortized constant.

Definition at line 406 of file unordered_set.h.

```
4.961.4.33 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator > void std::unordered_set< _Value, _Hash, _Pred,
_Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 421 of file unordered_set.h.

```
4.961.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert ( initializer_list<
value_type > __l ) [inline]
```

Attempts to insert a list of elements into the unordered_set.

Parameters

<code>__l</code>	A std::initializer_list<value_type> of elements to be inserted.
------------------	---

Complexity similar to that of the range constructor.

Definition at line 432 of file unordered_set.h.

4.961.4.35 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> key_equal std::unordered_set<_Value, _Hash, _Pred, _Alloc>::key_eq () const [inline]`

Returns the key comparison object with which the `unordered_set` was constructed.

Definition at line 528 of file `unordered_set.h`.

4.961.4.36 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float std::unordered_set<_Value, _Hash, _Pred, _Alloc>::load_factor () const [inline], [noexcept]`

Returns the average number of elements per bucket.

Definition at line 659 of file `unordered_set.h`.

4.961.4.37 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_bucket_count () const [inline], [noexcept]`

Returns the maximum number of buckets of the `unordered_set`.

Definition at line 594 of file `unordered_set.h`.

4.961.4.38 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> float std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_load_factor () const [inline], [noexcept]`

Returns a positive number that the `unordered_set` tries to keep the load factor less than or equal to.

Definition at line 665 of file `unordered_set.h`.

4.961.4.39 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_load_factor (float __z) [inline]`

Change the `unordered_set` maximum load factor.

Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 673 of file `unordered_set.h`.

4.961.4.40 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_size () const [inline], [noexcept]`

Returns the maximum size of the `unordered_set`.

Definition at line 261 of file `unordered_set.h`.

4.961.4.41 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::noexcept (noexcept(_M_h.swap(__x._M_h))) [inline]`

Swaps data with another `unordered_set`.

Parameters

<code>__x</code>	An unordered_set of the same element and allocator types.
------------------	---

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 514 of file `unordered_set.h`.

```
4.961.4.42  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
            const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

```
4.961.4.43  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
            unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

```
4.961.4.44  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
            initializer_list< value_type > __l ) [inline]
```

Unordered_set list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered_set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_set and that the resulting unordered_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 235 of file `unordered_set.h`.

```
4.961.4.45  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash ( size_type __n )
            [inline]
```

May rehash the unordered_set.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.

Definition at line 684 of file `unordered_set.h`.

```
4.961.4.46  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve ( size_type __n )
            [inline]
```

Prepare the unordered_set for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 695 of file `unordered_set.h`.

```
4.961.4.47  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc >::size ( ) const
            [inline], [noexcept]
```

Returns the size of the `unordered_set`.

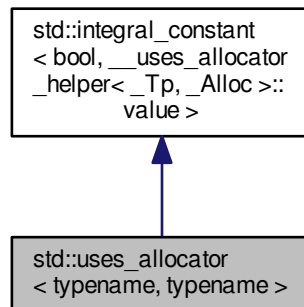

Definition at line 256 of file `unordered_set.h`.

4.964.1 Detailed Description

`template<class _Tp> class std::valarray<_Tp>`

Smart array designed to support numeric processing.

A `valarray` is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Template Parameters

<code>_Tp</code>	Type of object in the array.
------------------	------------------------------

Definition at line 78 of file `valarray`.

4.964.2 Constructor & Destructor Documentation

4.964.2.1 `template<class _Tp> std::valarray<_Tp>::valarray(const _Tp* __restrict__, size_t)`

Construct an array initialized to the first n elements of t .

The documentation for this class was generated from the following file:

- `valarray`

4.965.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class std::vector< _Tp, _Alloc >`

A standard container which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

Definition at line 210 of file `stl_vector.h`.

4.965.2 Constructor & Destructor Documentation

4.965.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (const allocator_type & __a = allocator_type()) [inline], [explicit], [noexcept]`

Creates a vector with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 250 of file `stl_vector.h`.

4.965.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector (size_type __n, const value_type & __value, const allocator_type & __a = allocator_type()) [inline]`

Creates a vector with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` copies of `__value`.

Definition at line 275 of file `stl_vector.h`.

4.965.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (const vector<_Tp, _Alloc> & __x) [inline]`

Vector copy constructor.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The newly-created vector uses a copy of the allocation object used by `__x`. All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied.

Definition at line 304 of file `stl_vector.h`.

4.965.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (vector<_Tp, _Alloc> && __x) [inline], [noexcept]`

Vector move constructor.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The newly-created vector contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified vector.

Definition at line 321 of file `stl_vector.h`.

4.965.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::vector (const vector<_Tp, _Alloc> & __x, const allocator_type & __a) [inline]`

Copy constructor with alternative allocator.

Definition at line 325 of file `stl_vector.h`.

4.965.3 Member Function Documentation

4.965.3.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator> pointer std::vector<_Tp, _Alloc>::M_allocate_and_copy (size_type __n, _ForwardIterator __first, _ForwardIterator __last) [inline], [protected]`

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

Definition at line 1201 of file `stl_vector.h`.

4.965.3.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::M_range_check (size_type __n) const [inline], [protected]`

Safety check used only from `at()`.

Definition at line 786 of file `stl_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::at()`.

4.965.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::assign (size_type __n, const value_type & __val) [inline]`

Assigns a given value to a vector.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 474 of file `stl_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::assign()`, and `std::vector< block_type, allocator_type >::operator=()`.

4.965.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::vector<_Tp, _Alloc>::assign (_InputIterator __first, _InputIterator __last) [inline]`

Assigns a range to a vector.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a vector with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 493 of file `stl_vector.h`.

4.965.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::assign (initializer_list< value_type > __l) [inline]`

Assigns an initializer list to a vector.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 519 of file `stl_vector.h`.

4.965.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::at (size_type __n) [inline]`

Provides access to the data contained in the vector.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read/write reference to data.

Exceptions

<i>std::out_of_range</i>	If <code>__n</code> is an invalid index.
--------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 808 of file `stl_vector.h`.

4.965.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::at (size_type __n) const [inline]`

Provides access to the data contained in the vector.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read-only (constant) reference to data.

Exceptions

<i>std::out_of_range</i>	If <code>__n</code> is an invalid index.
--------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 826 of file `stl_vector.h`.

4.965.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::back () [inline], [noexcept]`

Returns a read/write reference to the data at the last element of the vector.

Definition at line 853 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<_RealType>::max()`.

4.965.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::back () const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 861 of file `stl_vector.h`.

4.965.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::begin () [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 533 of file `stl_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::crend()`, `std::vector< block_type, allocator_type >::empty()`, `std::vector< block_type, allocator_type >::front()`, `std::vector< block_type, allocator_type >::insert()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator==()`, `std::vector< block_type, allocator_type >::rend()`, and `std::vector< block_type, allocator_type >::vector()`.

4.965.3.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::begin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 542 of file `stl_vector.h`.

4.965.3.12 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::capacity () const [inline], [noexcept]`

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 720 of file `stl_vector.h`.

4.965.3.13 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::cbegin () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 606 of file `stl_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::insert()`.

4.965.3.14 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::cend () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 615 of file `stl_vector.h`.

4.965.3.15 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::clear () [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1191 of file `stl_vector.h`.

4.965.3.16 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::crbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 624 of file `stl_vector.h`.

4.965.3.17 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::crend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 633 of file `stl_vector.h`.

4.965.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> _Tp* std::vector<_Tp, _Alloc>::data ()`
`[inline], [noexcept]`

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

Definition at line 876 of file `std_vector.h`.

Referenced by `std::regex_traits<_Ch_type>::transform_primary()`.

4.965.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator`
`std::vector<_Tp, _Alloc>::emplace (const_iterator __position, _Args &&... __args)`

Inserts an object in vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location`. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Referenced by `std::vector< block_type, allocator_type >::insert()`.

4.965.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::vector<_Tp, _Alloc>::empty ()`
`const [inline], [noexcept]`

Returns true if the vector is empty. (Thus `begin()` would equal `end()`.)

Definition at line 729 of file `std_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::densities()`, `std::piecewise_linear_distribution<_RealType>::densities()`, `std::piecewise_constant_distribution<_RealType>::intervals()`, `std::piecewise_linear_distribution<_RealType>::intervals()`, `std::discrete_distribution<_IntType>::max()`, `std::piecewise_constant_distribution<_RealType>::max()`, `std::piecewise_linear_distribution<_RealType>::max()`, `std::piecewise_constant_distribution<_RealType>::min()`, `std::piecewise_linear_distribution<_RealType>::min()`, and `std::discrete_distribution<_IntType>::probabilities()`.

4.965.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::end ()`
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 551 of file `std_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::back()`, `std::vector< block_type, allocator_type >::cbegin()`, `std::vector< block_type, allocator_type >::empty()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator==()`, `std::vector< block_type, allocator_type >::push_back()`, `std::vector< block_type, allocator_type >::rbegin()`, `std::vector< block_type, allocator_type >::resize()`, and `std::vector< block_type, allocator_type >::vector()`.

4.965.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::end () const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 560 of file `stl_vector.h`.

4.965.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::front () [inline], [noexcept]`

Returns a read/write reference to the data at the first element of the vector.

Definition at line 837 of file `stl_vector.h`.

Referenced by `std::vector< block_type, allocator_type >::data()`, `std::piecewise_constant_distribution< _RealType >::min()`, and `std::piecewise_linear_distribution< _RealType >::min()`.

4.965.3.24 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::front () const [inline], [noexcept]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 845 of file `stl_vector.h`.

4.965.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, const value_type & __x)`

Inserts given value into vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Referenced by `std::vector< block_type, allocator_type >::insert()`, and `std::vector< block_type, allocator_type >::resize()`.

4.965.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (const_iterator __position, value_type && __x) [inline]`

Inserts given rvalue into vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1000 of file `stl_vector.h`.

```
4.965.3.27 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position, initializer_list< value_type > __l ) [inline]
```

Inserts an `initializer_list` into the vector.

Parameters

<code>__position</code>	An iterator into the vector.
<code>__l</code>	An <code>initializer_list</code> .

This function will insert copies of the data in the `initializer_list l` into the vector before the location specified by `position`.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1017 of file `stl_vector.h`.

```
4.965.3.28 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert (
    const_iterator __position, size_type __n, const value_type & __x ) [inline]
```

Inserts a number of copies of given data into the vector.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `position`.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1037 of file `stl_vector.h`.

```
4.965.3.29 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
    std::_RequireInputIter<_InputIterator>> iterator std::vector< _Tp, _Alloc >::insert ( const_iterator __position,
    _InputIterator __first, _InputIterator __last ) [inline]
```

Inserts a range into the vector.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
-------------------------	--

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1081 of file `stl_vector.h`.

4.965.3.30 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::max_size (`
`) const [inline], [noexcept]`

Returns the `size()` of the largest possible vector.

Definition at line 645 of file `stl_vector.h`.

4.965.3.31 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= (`
`vector<_Tp, _Alloc> && __x) [inline], [noexcept]`

Vector move assignment operator.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). `__x` is a valid, but unspecified vector.

Definition at line 434 of file `stl_vector.h`.

4.965.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= (`
`initializer_list< value_type > __l) [inline]`

Vector list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 456 of file `stl_vector.h`.

4.965.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::operator[]`
`(size_type __n) [inline], [noexcept]`

Subscript access to the data contained in the vector.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 765 of file `std_vector.h`.

4.965.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::operator[](size_type __n) const [inline], [noexcept]`

Subscript access to the data contained in the vector.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 780 of file `std_vector.h`.

4.965.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::pop_back () [inline], [noexcept]`

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 935 of file `std_vector.h`.

4.965.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::push_back (const value_type &__x) [inline]`

Add data to the end of the vector.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 899 of file `std_vector.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

4.965.3.37 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rbegin () [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 569 of file `stl_vector.h`.

4.965.3.38 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 578 of file `stl_vector.h`.

4.965.3.39 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rend () [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 587 of file `stl_vector.h`.

4.965.3.40 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rend () const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 596 of file `stl_vector.h`.

4.965.3.41 `template<typename _Tp, typename _Alloc> void vector::reserve (size_type __n)`

Attempt to preallocate enough memory for specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Exceptions

<code>std::length_error</code>	If <code>n</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

Definition at line 66 of file `vector.tcc`.

References `std::_Destroy()`, and `std::size()`.

4.965.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize (size_type __new_size) [inline]`

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 659 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink_and_double()`, and `__gnu_parallel::multiway_merge_exact_splitting()`.

4.965.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::resize (`
`size_type __new_size, const value_type & __x) [inline]`

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 679 of file `stl_vector.h`.

4.965.3.44 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::shrink_to_fit (`
`) [inline]`

A non-binding request to reduce `capacity()` to `size()`.

Definition at line 711 of file `stl_vector.h`.

4.965.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::size ()`
`const [inline],[noexcept]`

Returns the number of elements in the vector.

Definition at line 640 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink()`, `__gnu_parallel::__shrink_and_double()`, `std::vector< block_type, allocator_type >::M_range_check()`, `__gnu_parallel::list_partition()`, `std::discrete_distribution< _IntType >::max()`, `std::operator==(, std::vector< block_type, allocator_type >::resize()`, and `std::regex_traits< _Ch_type >::transform_primary()`.

4.965.4 Member Data Documentation

4.965.4.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::__pad0__`
`[explicit]`

Creates a vector with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` default constructed elements.

Definition at line 264 of file `stl_vector.h`.

4.965.4.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::__pad1__`

Move constructor with alternative allocator.

Definition at line 336 of file `stl_vector.h`.

4.965.4.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::iterator`

Remove element at given position.

Remove a range of elements.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1136 of file `stl_vector.h`.

4.965.4.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::void`

Swaps data with another vector.

Parameters

<code>__x</code>	A vector of the same element and allocator types.
------------------	---

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Definition at line 1178 of file `stl_vector.h`.

4.966.1 Detailed Description

`template<typename _Alloc> class std::vector< bool, _Alloc >`

A specialization of `vector` for booleans which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

See Also

vector for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

Definition at line 526 of file `std_bvector.h`.

4.968.1 Detailed Description

```
template<typename _RealType = double> class std::weibull_distribution<_RealType>
```

A `weibull_distribution` random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

Definition at line 4848 of file random.h.

4.968.2 Member Typedef Documentation

4.968.2.1 `template<typename _RealType = double> typedef _RealType std::weibull_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 4851 of file random.h.

4.968.3 Member Function Documentation

4.968.3.1 `template<typename _RealType = double> _RealType std::weibull_distribution< _RealType >::a () const` [inline]

Return the a parameter of the distribution.

Definition at line 4906 of file random.h.

4.968.3.2 `template<typename _RealType = double> _RealType std::weibull_distribution< _RealType >::b () const` [inline]

Return the b parameter of the distribution.

Definition at line 4913 of file random.h.

4.968.3.3 `template<typename _RealType = double> result_type std::weibull_distribution< _RealType >::max () const` [inline]

Returns the least upper bound value of the distribution.

Definition at line 4942 of file random.h.

References `std::numeric_limits< _Tp >::max()`.

4.968.3.4 `template<typename _RealType = double> result_type std::weibull_distribution< _RealType >::min () const` [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4935 of file random.h.

4.968.3.5 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator> result_type` `std::weibull_distribution< _RealType >::operator() (UniformRandomNumberGenerator & __urng)` [inline]

Generating functions.

Definition at line 4950 of file random.h.

4.968.3.6 `template<typename _RealType = double> param_type std::weibull_distribution< _RealType >::param () const` [inline]

Returns the parameter set of the distribution.

Definition at line 4920 of file `random.h`.

Referenced by `std::operator>>()`.

4.968.3.7 `template<typename _RealType = double> void std::weibull_distribution<_RealType>::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4928 of file `random.h`.

4.968.3.8 `template<typename _RealType = double> void std::weibull_distribution<_RealType>::reset () [inline]`

Resets the distribution state.

Definition at line 4899 of file `random.h`.

4.968.4 Friends And Related Function Documentation

4.968.4.1 `template<typename _RealType = double> bool operator== (const weibull_distribution<_RealType> & __d1, const weibull_distribution<_RealType> & __d2) [friend]`

Return true if two Weibull distributions have the same parameters.

Definition at line 4985 of file `random.h`.

5.1.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [algo.h](#).

5.22.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort. It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

- `#define PB_DS_RANGED_HASH_FN_C_DEC`

5.54.1 Detailed Description

Contains an implementation class for `cc_ht_map_`.

Definition in file [cc_ht_map_.hpp](#).

5.55 ccomplex File Reference

Macros

- `#define _GLIBCXX_CCOMPLEX`

5.55.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [ccomplex](#).

5.56 ccomplex File Reference

Macros

- `#define _GLIBCXX_TR1_CCOMPLEX`

5.56.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/ccomplex](#).

5.57 ctype File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CCTYPE`

5.57.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [ctype](#).

5.58 ctype File Reference

Macros

- `#define _GLIBCXX_TR1_CCTYPE`

5.58.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cctype](#).

5.59 cerrno File Reference

Macros

- `#define _GLIBCXX_CERRNO`
- `#define errno`

5.59.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cerrno](#).

5.60 cenv File Reference

Macros

- `#define _GLIBCXX_CENV`

5.60.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cenv](#).

5.61 cenv File Reference

Macros

- `#define _GLIBCXX_TR1_CENV`

5.61.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cenv](#).

5.62 cfloat File Reference

Macros

- `#define _GLIBCXX_CFLOAT`
- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

5.62.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cfloat](#).

5.63 cfloat File Reference

5.73.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cmath](#).

5.74 cmath File Reference

- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

5.80.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [compiletime_settings.h](#).

5.80.2 Macro Definition Documentation

5.80.2.1 #define GLIBCXX_ASSERTIONS

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Definition at line 61 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

5.80.2.2 #define GLIBCXX_CALL(__n)

Macro to produce log message when entering a function.

Parameters

<code>__n</code>	Input size.
------------------	-------------

See Also

`_GLIBCXX_VERBOSE_LEVEL`

Definition at line 44 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_parallel::__merge_advance()`, `__gnu_parallel::__parallel_nth_element()`, `__gnu_parallel::__parallel_partial_sum()`, `__gnu_parallel::__parallel_partition()`, `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort_qs()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__parallel_unique_copy()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::__multiseq_partition()`, `__gnu_parallel::__multiseq_selection()`, `__gnu_parallel::__multiway_merge()`, `__gnu_parallel::__multiway_merge_3_variant()`, `__gnu_parallel::__multiway_merge_4_variant()`, `__gnu_parallel::__multiway_merge_loser_tree()`, `__gnu_parallel::__multiway_merge_loser_tree_sentinel()`, `__gnu_parallel::__multiway_merge_loser_tree_unguarded()`, `__gnu_parallel::__multiway_merge_sentinels()`, `__gnu_parallel::__parallel_multiway_merge()`, and `__gnu_parallel::__parallel_sort_mwms()`.

5.80.2.3 #define GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_parallel::__parallel_random_shuffle()`.

Definition at line 68 of file `compiletime_settings.h`.

5.80.2.4 #define GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the TLB for `gnu_parallel::__parallel_random_shuffle()`.

Definition at line 74 of file `compiletime_settings.h`.

5.80.2.5 `#define _GLIBCXX_SCALE_DOWN_FPU`

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file `comPILEtime_settings.h`.

5.80.2.6 `#define _GLIBCXX_VERBOSE_LEVEL`

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file `comPILEtime_settings.h`.

- `template<typename _Tp >`
`std::complex< _Tp > std::tr1::pow (const std::complex< _Tp > &__x, const std::complex< _Tp > &__y)`

5.82.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/complex](#).

5.83 complex.h File Reference

Macros

- `#define _GLIBCXX_COMPLEX_H`

5.83.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [complex.h](#).

5.84 concept_check.h File Reference

Macros

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

5.84.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

Definition in file [concept_check.h](#).

5.85 concurrence.h File Reference

Classes

- class [__gnu_cxx::__scoped_lock](#)

Namespaces

- [__gnu_cxx](#)

Enumerations

- enum `_Lock_policy` { `_S_single`, `_S_mutex`, `_S_atomic` }

Functions

- void `__gnu_cxx::__throw_concurrency_lock_error()`
- void `__gnu_cxx::__throw_concurrency_unlock_error()`

Variables

- static const `_Lock_policy` `__gnu_cxx::__default_lock_policy`

5.85.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file [concurrency.h](#).

5.86 cond_dealtor.hpp File Reference

Classes

- class [__gnu_pbds::detail::cond_dealtor](#)< `Entry`, `_Alloc` >

Namespaces

- [__gnu_pbds](#)

5.86.1 Detailed Description

Contains a conditional deallocator.

Definition in file [cond_dealtor.hpp](#).

5.87 cond_key_dtor_entry_dealtor.hpp File Reference

Classes

- class [__gnu_pbds::detail::cond_dealtor](#)< `Entry`, `_Alloc` >

Namespaces

- [__gnu_pbds](#)

5.87.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

Definition in file [cond_key_dtor_entry_dealtor.hpp](#).

5.88 condition_variable File Reference

Classes

- class [std::_V2::condition_variable_any](#)
- class [std::condition_variable](#)

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CONDITION_VARIABLE`

Enumerations

- enum [std::cv_status](#) { `no_timeout`, `timeout` }

5.88.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [condition_variable](#).

5.89 const_iterator.hpp File Reference

Classes

- class [__gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_BIN_HEAP_CIT_BASE`

5.89.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

Definition in file [binary_heap_/const_iterator.hpp](#).

5.90 `const_iterator.hpp` File Reference

Classes

- class [__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_BASIC_HEAP_CIT_BASE`
- `#define PB_DS_CLASS_C_DEC`

5.90.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

Definition in file [left_child_next_sibling_heap_/const_iterator.hpp](#).

5.91 `const_iterator.hpp` File Reference

Classes

- class [const_iterator_](#)

5.91.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.

Definition in file [unordered_iterator/const_iterator.hpp](#).

5.92 `constructor_destructor_fn_imps.hpp` File Reference

5.92.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

Definition in file [cc_hash_table_map_/constructor_destructor_fn_imps.hpp](#).

5.93 `constructor_destructor_fn_imps.hpp` File Reference

5.93.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

Definition in file [gp_hash_table_map_/constructor_destructor_fn_imps.hpp](#).

5.94 constructor_destructor_fn_imps.hpp File Reference

5.95 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.95.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.
Definition in file [cc_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp](#).

5.96 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.96.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.
Definition in file [gp_hash_table_map_/constructor_destructor_no_store_hash_fn_imps.hpp](#).

5.97 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.97.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.
Definition in file [cc_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp](#).

5.98 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.98.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.
Definition in file [gp_hash_table_map_/constructor_destructor_store_hash_fn_imps.hpp](#).

5.99 constructors_destructor_fn_imps.hpp File Reference

5.99.1 Detailed Description

Contains an implementation class for `binary_heap_`.
Definition in file [binary_heap_/constructors_destructor_fn_imps.hpp](#).

5.100 constructors_destructor_fn_imps.hpp File Reference

5.100.1 Detailed Description

Contains an implementation for `binomial_heap_`.
Definition in file [binomial_heap_/constructors_destructor_fn_imps.hpp](#).

5.101 constructors_destructor_fn_imps.hpp File Reference

5.101.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file [binomial_heap_base_/constructors_destructor_fn_imps.hpp](#).

5.102 constructors_destructor_fn_imps.hpp File Reference

5.102.1 Detailed Description

Contains an implementation class for bin_search_tree_.

Definition in file [bin_search_tree_/constructors_destructor_fn_imps.hpp](#).

5.103 constructors_destructor_fn_imps.hpp File Reference

5.103.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

Definition in file [left_child_next_sibling_heap_/constructors_destructor_fn_imps.hpp](#).

5.104 constructors_destructor_fn_imps.hpp File Reference

5.104.1 Detailed Description

Contains an implementation class for ov_tree_.

Definition in file [ov_tree_map_/constructors_destructor_fn_imps.hpp](#).

5.105 constructors_destructor_fn_imps.hpp File Reference

5.105.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file [pairing_heap_/constructors_destructor_fn_imps.hpp](#).

5.106 constructors_destructor_fn_imps.hpp File Reference

5.106.1 Detailed Description

Contains an implementation class for pat_trie.

Definition in file [pat_trie_/constructors_destructor_fn_imps.hpp](#).

5.107 constructors_destructor_fn_imps.hpp File Reference

5.107.1 Detailed Description

Contains an implementation for `rb_tree_`.

Definition in file [rb_tree_map_/constructors_destructor_fn_imps.hpp](#).

5.108 constructors_destructor_fn_imps.hpp File Reference

5.108.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

Definition in file [rc_binomial_heap_/constructors_destructor_fn_imps.hpp](#).

5.109 constructors_destructor_fn_imps.hpp File Reference

5.109.1 Detailed Description

Contains an implementation class for `splay_tree_`.

Definition in file [splay_tree_/constructors_destructor_fn_imps.hpp](#).

5.110 constructors_destructor_fn_imps.hpp File Reference

5.110.1 Detailed Description

Contains an implementation for `thin_heap_`.

Definition in file [thin_heap_/constructors_destructor_fn_imps.hpp](#).

5.111 container_base_dispatch.hpp File Reference

Classes

- [struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_TI >](#)
- [struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_TI >](#)
- [struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, list_update_tag, Policy_TI >](#)

- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2F(X)`
- `#define PB_DS_V2S(X)`
- `#define PB_DS_V2S(X)`

5.111.1 Detailed Description

Contains associative container dispatching.

Definition in file [container_base_dispatch.hpp](#).

5.112 `cpp_type_traits.h` File Reference

Classes

- class [std::move_iterator<_Iterator>](#)

Namespaces

- [__gnu_cxx](#)
- [std](#)

5.112.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/type_traits>`.

Definition in file [cpp_type_traits.h](#).

5.113 `cpu_defines.h` File Reference

5.113.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

Definition in file [cpu_defines.h](#).

5.114 `csetjmp` File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSETJMP`
- `#define setjmp(env)`

5.114.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [csetjmp](#).

5.115 `csignal` File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSIGNAL`

5.115.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [csignal](#).

5.116 `cstdarg` File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSTDARG`
- `#define va_end(ap)`

5.116.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdarg](#).

5.117 `cstdarg` File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDARG`

5.117.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdarg](#).

5.118 `cstdbool` File Reference

Macros

- `#define _GLIBCXX_CSTDBOOL`

5.118.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cstdbool](#).

5.119 `cstdbool` File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDBOOL`

5.119.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdbool](#).

5.120 `cstddef` File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSTDDEF`

5.120.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stddef.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstddef](#).

5.121 cstdint File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSTDINT`

5.121.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cstdint](#).

5.122 cstdint File Reference

Namespaces

- [std](#)
- [std::tr1](#)

Macros

- `#define _GLIBCXX_TR1_CSTDINT`

5.122.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdint](#).

5.123 `cstdio` File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSTDIO`

Functions

- `char * gets (char * __s) __attribute__((deprecated))`

5.123.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdio](#).

5.124 `cstdio` File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDIO`

5.124.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdio](#).

5.125 `cstdlib` File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSTDLIB`
- `#define EXIT_FAILURE`
- `#define EXIT_SUCCESS`

Functions

- void **std::abort** (void) throw ()
- int **std::atexit** (void(*) (void)) throw ()
- void **std::exit** (int) throw ()

5.125.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdlib](#).

5.126 cstdlib File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDLIB`

5.126.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdlib](#).

5.127 cstring File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CSTRING`

Functions

- void * **std::memchr** (void * __s, int __c, size_t __n)
- char * **std::strchr** (char * __s, int __n)
- char * **std::strpbrk** (char * __s1, const char * __s2)
- char * **std::strrchr** (char * __s, int __n)
- char * **std::strstr** (char * __s1, const char * __s2)

5.127.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstring](#).

5.128 ctgmath File Reference

Macros

- `#define _GLIBCXX_CTGMATH`

5.128.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [ctgmath](#).

5.129 ctgmath File Reference

Macros

- `#define _GLIBCXX_TR1_CTGMATH`

5.129.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/ctgmath](#).

5.130 ctime File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CTIME`

5.130.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [ctime](#).

5.131 ctime File Reference

Macros

- `#define _GLIBCXX_TR1_CTIME`

5.131.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/ctime](#).

5.132 ctype_base.h File Reference

Classes

- struct [std::ctype_base](#)

Namespaces

- [std](#)

5.132.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

Definition in file [ctype_base.h](#).

5.133 ctype_inline.h File Reference

Namespaces

- [std](#)

5.133.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

Definition in file [ctype_inline.h](#).

5.134 cwchar File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CWCHAR`

Functions

- `wchar_t * std::wcschr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcpbrk (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wcsrchr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcsstr (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wmemchr (wchar_t *__p, wchar_t __c, size_t __n)`

5.134.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cwchar](#).

5.135 cwchar File Reference

Namespaces

- [std](#)
- [std::tr1](#)

Macros

- `#define _GLIBCXX_TR1_CWCHAR`

5.135.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cwchar](#).

5.136 cwctype File Reference

Namespaces

- [std](#)

Macros

- `#define _GLIBCXX_CWCTYPE`

5.136.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cwctype](#).

5.137 `cwctype` File Reference

Namespaces

- [std](#)
- [std::tr1](#)

Macros

5.138.1 Detailed Description

The header provides an interface to the C++ ABI.

Definition in file [cxxabi.h](#).

5.139 `cxxabi_forced.h` File Reference

Classes

- class [__cxxabiv1::__forced_unwind](#)

5.139.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

Definition in file [cxxabi_forced.h](#).

5.140 `cxxabi_tweaks.h` File Reference

Macros

- `#define _GLIBCXX_CXA_VEC_CTOR_RETURN(x)`
- `#define _GLIBCXX_GUARD_BIT`
- `#define _GLIBCXX_GUARD_PENDING_BIT`
- `#define _GLIBCXX_GUARD_SET(x)`
- `#define _GLIBCXX_GUARD_TEST(x)`
- `#define _GLIBCXX_GUARD_WAITING_BIT`

Typedefs

- `typedef void __cxxabiv1::__cxa_cdtor_return_type`
- `typedef void __cxxabiv1::__cxa_vec_ctor_return_type`

Functions

- `__extension__ typedef int __guard __cxxabiv1::__attribute__ ((mode(__DI__)))`

5.140.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

5.141.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file [debug.h](#).

5.142 debug_allocator.h File Reference

Classes

- class [__gnu_cxx::debug_allocator< _Alloc >](#)

Namespaces

- [__gnu_cxx](#)

Functions

- `template<typename _Alloc >`
`bool __gnu_cxx::operator!= (const debug_allocator< _Alloc > &__lhs, const debug_allocator< _Alloc > &__rhs)`

5.142.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file [debug_allocator.h](#).

5.143 `debug_fn_imps.hpp` File Reference

5.143.1 Detailed Description

Contains an implementation class for a `binary_heap`.

Definition in file [binary_heap_/debug_fn_imps.hpp](#).

5.144 `debug_fn_imps.hpp` File Reference

5.144.1 Detailed Description

Contains an implementation for `binomial_heap_`.

Definition in file [binomial_heap_/debug_fn_imps.hpp](#).

5.145 `debug_fn_imps.hpp` File Reference

5.145.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file [binomial_heap_base_/debug_fn_imps.hpp](#).

5.146 `debug_fn_imps.hpp` File Reference

5.146.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

Definition in file [bin_search_tree_/debug_fn_imps.hpp](#).

5.147 `debug_fn_imps.hpp` File Reference

5.147.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [cc_hash_table_map_/debug_fn_imps.hpp](#).

5.148 `debug_fn_imps.hpp` File Reference

5.148.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

Definition in file [gp_hash_table_map_/debug_fn_imps.hpp](#).

5.149 `debug_fn_imps.hpp` File Reference

5.149.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

Definition in file [left_child_next_sibling_heap_/debug_fn_imps.hpp](#).

5.150 debug_fn_imps.hpp File Reference

5.150.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [list_update_map_/debug_fn_imps.hpp](#).

5.151 debug_fn_imps.hpp File Reference

5.151.1 Detailed Description

Contains an implementation class for `ov_tree_`.

Definition in file [ov_tree_map_/debug_fn_imps.hpp](#).

5.152 debug_fn_imps.hpp File Reference

5.152.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file [pairing_heap_/debug_fn_imps.hpp](#).

5.153 debug_fn_imps.hpp File Reference

5.153.1 Detailed Description

Contains an implementation class for `pat_trie_`.

Definition in file [pat_trie_/debug_fn_imps.hpp](#).

5.154 debug_fn_imps.hpp File Reference

5.154.1 Detailed Description

Contains an implementation for `rb_tree_`.

Definition in file [rb_tree_map_/debug_fn_imps.hpp](#).

5.155 debug_fn_imps.hpp File Reference

5.155.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

Definition in file [rc_binomial_heap_/debug_fn_imps.hpp](#).

5.156 `debug_fn_imps.hpp` File Reference

5.156.1 Detailed Description

Contains an implementation class for `splay_tree_`.

Definition in file [splay_tree_/debug_fn_imps.hpp](#).

5.157 `debug_fn_imps.hpp` File Reference

5.157.1 Detailed Description

Contains an implementation for `thin_heap_`.

Definition in file [thin_heap_/debug_fn_imps.hpp](#).

5.158 `debug_map_base.hpp` File Reference

5.158.1 Detailed Description

Contains a debug-mode base for all maps.

Definition in file [debug_map_base.hpp](#).

5.159 `debug_no_store_hash_fn_imps.hpp` File Reference

5.159.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [cc_hash_table_map_/debug_no_store_hash_fn_imps.hpp](#).

5.160 `debug_no_store_hash_fn_imps.hpp` File Reference

5.160.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

Definition in file [gp_hash_table_map_/debug_no_store_hash_fn_imps.hpp](#).

5.161 `debug_store_hash_fn_imps.hpp` File Reference

5.161.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

Definition in file [cc_hash_table_map_/debug_store_hash_fn_imps.hpp](#).

5.162 debug_store_hash_fn_imps.hpp File Reference

5.162.1 Detailed Description

Contains implementations of `gp_ht_map_`'s debug-mode functions.

Definition in file [gp_hash_table_map_/debug_store_hash_fn_imps.hpp](#).

5.163 decimal File Reference

5.163.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [decimal](#).

5.164 deque File Reference

Macros

- `#define _GLIBCXX_DEQUE`

5.164.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [deque](#).

5.165 deque File Reference

Classes

- class `std::__debug::deque<_Tp, _Allocator>`

Namespaces

- `std`
- `std::__debug`

Macros

- `#define _GLIBCXX_DEBUG_DEQUE`

Functions

- `template<typename _Tp, typename _Alloc >`
`bool std::__debug::operator!= (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)`
- `template<typename _Tp, typename _Alloc >`

- `#define _GLIBCXX_TREE_DYNAMIC_BALANCING`
- `#define _GLIBCXX_TREE_FULL_COPY`
- `#define _GLIBCXX_TREE_INITIAL_SPLITTING`

5.205.1 Detailed Description

Defines on whether to include algorithm variants. Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [features.h](#).

5.205.2 Macro Definition Documentation

5.205.2.1 `#define _GLIBCXX_BAL_QUICKSORT`

Include parallel dynamically load-balanced quicksort.

See Also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 55 of file `features.h`.

5.205.2.2 `#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

Include the equal-sized blocks variant for `std::find`.

See Also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 67 of file `features.h`.

5.205.2.3 `#define _GLIBCXX_FIND_EQUAL_SPLIT`

Include the equal splitting variant for `std::find`.

See Also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 74 of file `features.h`.

5.205.2.4 `#define _GLIBCXX_FIND_GROWING_BLOCKS`

Include the growing blocks variant for `std::find`.

See Also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 61 of file `features.h`.

5.205.2.5 `#define _GLIBCXX_MERGESORT`

Include parallel multi-way mergesort.

See Also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 41 of file `features.h`.

5.205.2.6 `#define _GLIBCXX_QUICKSORT`

Include parallel unbalanced quicksort.

See Also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 48 of file `features.h`.

5.205.2.7 `#define _GLIBCXX_TREE_DYNAMIC_BALANCING`

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See Also

`__gnu_parallel::_Rb_tree`

Definition at line 91 of file `features.h`.

5.205.2.8 **#define** `_GLIBCXX_TREE_FULL_COPY`

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See Also

`__gnu_parallel::_Rb_tree`

Definition at line 100 of file `features.h`.

5.205.2.9 **#define** `_GLIBCXX_TREE_INITIAL_SPLITTING`

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See Also

`__gnu_parallel::_Rb_tree`

Definition at line 83 of file `features.h`.

5.206 **fenv.h** File Reference

`std::iterator_traits< _Iter >::difference_type __bound, _Parallelism __parallelism_tag`)

5.223.1 Detailed Description

Main interface for embarrassingly parallel functions. The explicit implementation are in other header files, like `workstealing.h`, `par_loop.h`, `omp_loop.h`, and `omp_loop_static.h`. This file is a GNU parallel extension to the Standard C++ Library.

Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch24.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the [HOWTO](#) linked to above.

- istream [std::cin](#)
- ostream [std::cout](#)
- ostream [std::cerr](#)
- ostream [std::clog](#)
- wistream [std::wcin](#)
- wostream [std::wcout](#)
- wostream [std::wcerr](#)
- wostream [std::wclog](#)

5.290.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [iostream](#).

5.326.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file [macros.h](#).

5.326.2 Macro Definition Documentation

5.326.2.1 `#define __glibcxx_check_erase(_Position)`

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

Definition at line 141 of file [macros.h](#).

5.326.2.2 `#define __glibcxx_check_erase_after(_Position)`

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

Definition at line 155 of file [macros.h](#).

5.326.2.3 `#define __glibcxx_check_erase_range(_First, _Last)`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 169 of file `macros.h`.

5.326.2.4 `#define __glibcxx_check_erase_range_after(_First, _Last)`

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

Definition at line 181 of file `macros.h`.

5.326.2.5 `#define __glibcxx_check_heap_pred(_First, _Last, _Pred)`

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

Definition at line 331 of file `macros.h`.

5.326.2.6 `#define __glibcxx_check_insert(_Position)`

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 73 of file `macros.h`.

5.326.2.7 `#define __glibcxx_check_insert_after(_Position)`

Verify that we can insert into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 90 of file `macros.h`.

5.326.2.8 `#define __glibcxx_check_insert_range(_Position, _First, _Last)`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

Definition at line 106 of file `macros.h`.

5.326.2.9 `#define __glibcxx_check_insert_range_after(_Position, _First, _Last)`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Todo We would like to be able to check for noninterference of `_Position` and the range `[_First, _Last)`, but that can't (in general) be done.

Definition at line 128 of file `macros.h`.

5.326.2.10 `#define __glibcxx_check_partitioned_lower(_First, _Last, _Value)`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

Definition at line 275 of file `macros.h`.

5.326.2.11 `#define __glibcxx_check_partitioned_lower_pred(_First, _Last, _Value, _Pred)`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 297 of file `macros.h`.

5.326.2.12 `#define __glibcxx_check_partitioned_upper_pred(_First, _Last, _Value, _Pred)`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 310 of file `macros.h`.

5.326.2.13 `#define __glibcxx_check_sorted_pred(_First, _Last, _Pred)`

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

Definition at line 241 of file `macros.h`.

5.326.2.14 `#define _GLIBCXX_DEBUG_VERIFY_AT(_Condition, _ErrorMessage, _File, _Line)`

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 41 of file `macros.h`.

- void [operator delete](#) (void *, void *) noexcept
- void [operator delete\[\]](#) (void *, void *) noexcept

Variables

- const nothrow_t **std::nothrow**

5.352.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see http://gcc.gnu.org/onlinedocs/libstdc++/18_support/howto.html#4 for more.

Definition in file [new](#).

5.352.2 Function Documentation

5.352.2.1 void operator delete (void *) [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.2 void operator delete (void *, const std::nothrow_t &) [nothrow]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.3 void operator delete (void *, void *) [inline], [nothrow]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 152 of file new.

5.352.2.4 void operator delete[] (void *) [nothrow]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.5 void operator delete[] (void *, const std::nothrow_t &) [nothrow]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.6 `void operator delete[] (void *, void *) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 153 of file `new`.

5.352.2.7 `void* operator new (std::size_t)`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.8 `void* operator new (std::size_t, const std::nothrow_t &) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.9 `void* operator new (std::size_t, void * __p) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 146 of file `new`.

5.352.2.10 `void* operator new[](std::size_t)`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.11 `void* operator new[](std::size_t, const std::nothrow_t &) [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.352.2.12 `void* operator new[](std::size_t, void *__p) [inline], [nothrow]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 148 of file `new`.

5.364.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [parallel/numeric](#).

5.407.1 Detailed Description

Algorithms used by the profile extension. This file is needed to avoid including `<algorithm>` or `<bits/stl_algo.h>`. Including those files would result in recursive includes. These implementations are oversimplified. In general, efficiency may be sacrificed to minimize maintenance overhead.

Definition in file [profiler_algos.h](#).

- `#define PB_DS_STRUCT_ONLY_ASSERT_VALID(X)`

5.438.1 Detailed Description

Contains an implementation for Red Black trees.

Definition in file [rb_tree.hpp](#).

5.439 `rc.hpp` File Reference

Classes

- class [__gnu_pbds::detail::rc](#)< _Node, _Alloc >

Namespaces

- [__gnu_pbds](#)

5.439.1 Detailed Description

Contains a redundant (binary counter).

Definition in file [rc.hpp](#).

5.440 rc_binomial_heap.hpp File Reference

Classes

- class [__gnu_pbds::detail::rc_binomial_heap< Value_Type, Cmp_Fn, _Alloc >](#)

Namespaces

- [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_RC_C_DEC`

5.440.1 Detailed Description

Contains an implementation for redundant-counter binomial heap.

Definition in file [rc_binomial_heap.hpp](#).

5.441 rc_string_base.h File Reference

Classes

- class [__gnu_cxx::__rc_string_base< _CharT, _Traits, _Alloc >](#)

Namespaces

- [__gnu_cxx](#)

5.441.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/vstring.h>`.

Definition in file [rc_string_base.h](#).

5.442 regex File Reference

Macros

- `#define _GLIBCXX_REGEX`

5.442.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [regex](#).

5.443 `regex.h` File Reference

Classes

- class [std::basic_regex](#)< [_Ch_type](#), [_Rx_traits](#) >

5.494.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [set_operations.h](#).

5.495 settings.h File Reference

Classes

- struct [__gnu_parallel::_Settings](#)

Namespaces

- [__gnu_parallel](#)

Macros

- #define [_GLIBCXX_PARALLEL_CONDITION\(__c\)](#)

5.495.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

5.495.2 parallelization_decision

The decision whether to run an algorithm in parallel.

There are several ways the user can switch on and __off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
*  std::sort (__v.begin(), __v.end(), __gnu_parallel::sequential_tag(
    ));
*
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. _It is a tristate variable corresponding to:

- force_sequential, meaning the sequential algorithm is executed.
- force_parallel, meaning the parallel algorithm is executed.
- heuristic

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(__s). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

Definition in file [settings.h](#).

5.495.3 Macro Definition Documentation

5.495.3.1 `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

<code>__c</code>	A condition that is convertible to bool that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> . Usually a decision based on the input size.
------------------	---

Definition at line 95 of file `settings.h`.

5.497.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

Definition in file [shared_ptr_base.h](#).

5.498 size_fn_imps.hpp File Reference

5.498.1 Detailed Description

Contains implementations of `cc_ht_map_`'s entire container size related functions.

Definition in file [size_fn_imps.hpp](#).

5.499 slice_array.h File Reference

Classes

- class [std::slice](#)
- class [std::slice_array< _Tp >](#)

Namespaces

- [std](#)

Macros

- `#define _DEFINE_VALARRAY_OPERATOR(_Op, _Name)`

5.499.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

Definition in file [slice_array.h](#).

5.500 slist File Reference

Classes

- class [__gnu_cxx::slist< _Tp, _Alloc >](#)

Namespaces

- [__gnu_cxx](#)
- [std](#)

Macros

- `#define _SLIST`

Functions

- `_Slist_node_base * __gnu_cxx::__slist_make_link (_Slist_node_base * __prev_node, _Slist_node_base * __new_node)`

5.503.1 Detailed Description

Contains an implementation class for splay trees.

Definition in file [splay_tree_.hpp](#).

5.504 [split_fn_imps.hpp](#) File Reference

5.504.1 Detailed Description

Contains an implementation class for `pat_trie`.

Definition in file [split_fn_imps.hpp](#).

5.505 `split_join_fn_imps.hpp` File Reference

5.505.1 Detailed Description

Contains an implementation class for a `binary_heap`.

Definition in file [binary_heap_/split_join_fn_imps.hpp](#).

5.506 `split_join_fn_imps.hpp` File Reference

5.506.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

Definition in file [binomial_heap_base_/split_join_fn_imps.hpp](#).

5.507 `split_join_fn_imps.hpp` File Reference

5.507.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

Definition in file [bin_search_tree_/split_join_fn_imps.hpp](#).

5.508 `split_join_fn_imps.hpp` File Reference

5.508.1 Detailed Description

Contains an implementation class for `ov_tree_`.

Definition in file [ov_tree_map_/split_join_fn_imps.hpp](#).

5.509 `split_join_fn_imps.hpp` File Reference

5.509.1 Detailed Description

Contains an implementation class for a pairing heap.

Definition in file [pairing_heap_/split_join_fn_imps.hpp](#).

5.510 `split_join_fn_imps.hpp` File Reference

5.510.1 Detailed Description

Contains an implementation for `rb_tree_`.

Definition in file [rb_tree_map_/split_join_fn_imps.hpp](#).

5.511 `split_join_fn_imps.hpp` File Reference

5.511.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

Definition in file [rc_binomial_heap_/split_join_fn_imps.hpp](#).

5.512 [split_join_fn_imps.hpp](#) File Reference

5.512.1 Detailed Description

Contains an implementation class for `splay_tree_`.

Definition in file [splay_tree_/split_join_fn_imps.hpp](#).

5.513 [split_join_fn_imps.hpp](#) File Reference

5.513.1 Detailed Description

Contains an implementation for `thin_heap_`.

Definition in file [thin_heap_/split_join_fn_imps.hpp](#).

5.514 [sso_string_base.h](#) File Reference

Namespaces

- [__gnu_cxx](#)

5.514.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/vstring.h>`.

Definition in file [sso_string_base.h](#).

5.528.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<deque>`.

Definition in file [std_deque.h](#).

5.528.2 Macro Definition Documentation

5.528.2.1 `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

Parameters

<code>__size</code>	The size of an element.
---------------------	-------------------------

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

Definition at line 85 of file `stl_deque.h`.

5.531.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

This file implements `reverse_iterator`, `back_insert_iterator`, `front_insert_iterator`, `insert_iterator`, `__normal_iterator`, and their supporting functions and overloaded operators.

Definition in file [std_iterator.h](#).

5.532 `std_iterator_base_funcs.h` File Reference

5.542.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except `std_utility.h`. For more information, see the thread of about twenty messages starting with <http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html>, or http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads

Short summary: the `rel_ops` operators should be avoided for the present.

5.565.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

Definition in file [throw_allocator.h](#).

5.566 `time_members.h` File Reference

Namespaces

- [std](#)

5.566.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<locale>`.

Definition in file [time_members.h](#).

5.567 `trace_fn_imps.hpp` File Reference

5.567.1 Detailed Description

Contains an implementation class for a `binary_heap`.

Definition in file [binary_heap_/trace_fn_imps.hpp](#).

5.568 `trace_fn_imps.hpp` File Reference

5.568.1 Detailed Description

Contains implementations of `cc_ht_map_`'s trace-mode functions.

Definition in file [cc_hash_table_map_/trace_fn_imps.hpp](#).

5.569 `trace_fn_imps.hpp` File Reference

5.569.1 Detailed Description

Contains implementations of `gp_ht_map_`'s trace-mode functions.

Definition in file [gp_hash_table_map_/trace_fn_imps.hpp](#).

5.570 `trace_fn_imps.hpp` File Reference

5.570.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

5.622.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing. Work stealing is described in

R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. *Journal of the ACM*, 46(5):720–748, 1999.

This file is a GNU parallel extension to the Standard C++ Library.
